1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .legal group? A significant part of the traffic in rec.ham-radio is concerned with legal issues. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .legal, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any legal issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, and the like. .legal is the best description of the intended division of existing traffic I could come up with.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur[.misc]) only, and moving the technical postings off would deprive those on the mailing list.

OPEN ISSUES:
============
1. rec.radio.amateur or rec.radio.amateur.misc? Both have been
proposed, and I don't have a strong preference either way. The final
proposal will reflect whatever the consensus of the discussion is.

2. rec.radio.amateur.packet or rec.radio.amateur.digital? I do have
a preference here, but am willing to change my mind if a consensus is
reached that .digital is a better idea.

PLANS:
======
Assuming a consensus is reached by then, I intend to adhere to the
schedule I set originally: discussion to run through 31 December, with
the vote starting then and running through 21 January. There have been
a couple of other reorganizations in the recent past, and I'll follow
the precedent they set in regard to voting: an individual vote is
required for each proposed group. In addition, I like Kent Paul
Dolan's format for the comp.sys.amiga reorganization vote, and will
use it for this vote (though I'll put the ballot at the top of the
Call for Votes). I intend to count votes automagically with some sort
of Unix-type tool (probably awk); votes that the awk script rejects
will either be fixed if their meaning is unambiguous, or returned with
a request for clarification if not. Other than that, votes will be
acknowledged en masse about halfway through the voting period, and not
by mail. Votes will be sent to this site, and probably to my account
here. (Don't send me votes yet; I can't accept them.)

It looks like we can bring this to a successful conclusion, especiallly
if everyone maintains the same high standard of calm, reasoned discussion
that's been shown so far. Please post any discussion to news.groups as
well as rec.ham-radio, as per the guidelines.

I am (still) trying to locate software that can be used to decode
satellite data on my amiga. I have heard through friend-of-a-
friend-type references that such software exists but so far I have not
yet gotten anything into my hands. any information would be useful.
     gratefully,
     owen white

I think I missed something somewhere. As a true hacker willing to try
anything once, I grab the RSWD1111.ZIP file. I thought I would burn a
chip to try in one of my spare TNCs. When I unZIP the file, it is all
TXT files. There were no .EXE .BIN or anything else.

I am still interested in trying the rose software. Is there someplace
other than simtel20 that has the .ZIP file?   (simtel20 is ALWAYS busy)

thanks in advance,   mjb.--

Tom Clark of the SAREX team reports that so far he has only received
about a dozen reports of QRZ beacons copied from the WA4SIR robot
packet station aboard STS-35. Those beacons listed the calls heard but

not necessarily worked by the robot. (I.e., calls captured by the TNC's
MHEARD command.)

```
    ******************************************************
    * Unlike the list of stations  actually worked by the *
    * robot, the MHEARD  list was NOT stored  by the TNC. *
    * This  means that  stations heard by  the robot will *
    * not be eligible for QSL cards unless the SAREX team *
    * sees QRZ beacon text containing their callsigns.    *
    ******************************************************
```

So PLEASE, if you captured any QRZ beacons from the WA4SIR robot,
forward them to SAREX@W3IWI.MD.USA or to sarex@tomcat.gsfc.nasa.gov.

One of your friends may wind up with a SAREX QSL this way! Maybe
another Usenetter! Maybe me! :-)

73,
Patty

Given the way HDLC works, this is easier said than done. Errors could
easily upset the bit-stuffing logic, so bits might be added or deleted
and you might not know where you are in the packet. This would make it
difficult to compare bits between packets. And if the errors lose (or
create) flags, you're pretty much hosed.

The right way to do forward error correction (which is what you're describing)
is to design a completely new framing scheme that is intended to work with
a convolutional or block-coded FEC code. This means having special "sync"
sequences at the beginning of each frame that can be recognized even if
some bits are damaged, among other things. It also assumes that your
errors are gaussian, which may not be a valid assumption given that most
packets are lost due to collisions with other stations.

One FEC scheme that would retain the current framing method would work at
a somewhat higher layer. Send your message as a series of HDLC frames, as
you do now. Append to this a series of "parity" frames generated with a
Reed-Solomon block code. At the receiver, you discard all frames with CRC
errors. Then use the Reed-Solomon code to regenerate the missing frames
from the frames you got.

This is known as an "erasure correcting" (as opposed to "error correcting") code because you still use the individual frame CRCs to detect the errors, i.e., to generate "erased" frames. The nice thing about the Reed Solomon code when used this way is that it can regenerate ANY combination of erased frames, up to the number of parity frames that were originally sent.

For example, if your transmission consists of 10 message frames and 4 parity frames (a total of 14 frames) then you could lose any combination of up to 4 frames out of this transmission and still not lose any data.

To be able to recover from the loss of any 4 frames in a transmission that uses simple "repetition coding" (i.e., sending everything multiple times) you'd have to send each data frame 5 times, for a total of 50 frames on the channel. And of course given the larger number of frames, this would be a frame loss rate of only 4/50 = 8%, compared to a tolerable loss rate for the Reed-Solomon case of 4/14 = 28%.

The same Reed-Solomon software could be used at the transmitter and receiver; consider that the generation of the parity frames at the transmitter is exactly the same operation as regenerating them at the receiver when they're lost in transit. Of course, a receiver need not always invoke the erasure-correcting code; if it gets all of the data frames OK, it can simply ignore the parity frames since they're not needed.

This scheme is still not as effective against random (gaussian) noise as a bit-level FEC code would be, but it is something that could be implemented in amateur packet radio without any hardware changes. It would be especially effective in a broadcast protocol; I've recommended it for use in the Microsat/Pacsat satellite broadcast protocol.

Much of the credit for this idea goes to my Bellcore colleague Tony McAuley, who originally suggested this scheme for use on broadband ISDN in his SIGCOMM '90 paper. When I read it I realized that the exact same scheme could be applied to amateur packet radio.

I tried to reply to this earlier, but as usual, our computer system
crashed, sysops messing with the operating system again, why they cant
leave things alone beats me. Anyway, the answer to the question is Yes.

From your posting, I think you are confusing baud with bits per second.
They are not the same think at all. 1 baud is one symbol per second, and
one symbol may represent more than one bit (or less for that matter).

The number of bits a symbol represents depends on the alphabet (ie how
many different symbols there are). In computing circles we are normally
only concerned with two symbols, 0 and 5V in TTL or +12 and -12V in RS232.
If you imagine a system that had four states, say 0V 1V 2V 3V, then it
would be possible to send two bits at once. This is because two bits can
represent a maximum of four states (00 01 11 10). If we were to transmit
one of these symbols each second, then we would be sending at 1 baud, but
at 2 bits/sec. I am sorry if this is overly simplified, I am trying to
make it as clear as possible.

Telephone modems use a transmission technique with an alphabet of many
symbols. If for example you consider a QPSK modem, this has four symbols,
represented by the phase of the carrier. A channel at 2400 baud QPSK,
carries 4800 bits per second, but only requires a minimum of 2.4 kHz
bandwidth. If 64 phase modulation is used, then 8 bits can be sent at
once, and the bit rate would be 19.2 kbits per second. (This is not how
the telephone modems do it). To prevent inter symbol interference, and
make use of real filters, the bandwidth for phase shift keying needs to be
about 1.4 times the baud rate, so 2400 baud will work down a 3.4 kHz
telephone channel. As you increase the number of symbols, there is a
greater chance of noise causing one symbol to be mistaken for another. As
a general rule, doubling the number of symbols requires a doubling in the
signal to noise ratio to maintain the same error rate. Assuming that the
SNR is infinate, the any data rate can be supported in a channel of

arbitarily small bandwidth. In the real world, 8 bits per baud is about
the limit, though 256 and 512 symbol alphabets are possible in complex
(read expensive) systems.

All this is based on Shannons' theory. For maore information, look up
Shannon in the local library.
73 Mike

Howdy:

I fear that AMSAT has not been emphatic enough in pointing out what
is required for a successful shuttle ROBOT QSO. I disagree with
these stringent requirements so don't shout at me (i.e. don't shoot
the messenger). Let's say you connected to WA4SIR and you got the
UA (your TNC said *** CONNECTED TO WA4SIR) and then you received
your QSO number (Hello N4HY you are QSO # 234 . . . etc). You have
a QSO and your QSL is in the mail right?   _NO_ _WRONG_.

The following procedure is REQUIRED for you to be in the log IN
ANY WAY upon its being dumped on the ground.

(1) You send a connect request to WA4SIR (SABM You->WA4SIR)
(2) You receive an ack from WA4SIR (UA WA4SIR->You)
(3) You receive your QSO # from WA4SIR (I WA4SIR->You)

I would have said here you were done and should be in the log
but IF AND ONLY IF you have <completed> the next step are you
in the log. THERE IS NO REPRIEVE.

(4) YOUR ACK TO THE I FRAME IS HEARD (RR You->WA4SIR)

A small percentage of those with QSO numbers managed step 4 as the
crowds went wild after hearing a few get through 1-3. About the only
way can you be sure that (4) was completed is that you will receive a
QSL card from ARRL.

IMNSHO this was clearly a mistake. On the earlier missions if they
heard you on a audio casette you got a card. If I sound down
its because I too am in the QRZ and NOT the QSL list after two
successful connects. I am urging that this be modified for the
Ken Cameron mission. Comments?

Yes! I agree wholeheartedly. The SABM/UA and receipt of the I frame
with your QSO # should be enough.

I too connected, got a QSO number, but suspect my ack wasn't received.
This was on the second to last orbit, so I never saw a QSL list.
It was a real rush to see "CONNECTED TO WA4SIR".

I'll go one step further - with all the stations trying, why not save
the QRZ list and QSL *BOTH* the heard stations and the completed QSO
stations - with an indication on the QSL card whether you were just
heard or completed a QSO.

Oh maybe one more thing - how about an external antenna on that robot
arm or something? :-) I missed a lot of should-have-been-great passes
apparently because of shuttle/antenna orientation.

In the book "Your Gateway to Packet Radio", in a chapter discussing the use of packet radio for public service communications and emergency communications in particular, it mentions a piece of software called ARES/Data. The Clemson University ARC is interested in utilizing packet radio for emergency and public-service work, which is what the software is designed for.

According to the book, it states that it (ARES/Data) is copyrighted but public domain and available without charge. Is it available from an FTP site, by any chance?? Are there any other sources for the software that anyone knows?

Also, it book mentions that to use the ARES/Data program, you need the TNC to have the WA8DED firmware installed. Where is THIS available from? (I can burn the EEPROM, if I can get the code, or is it not public domain?).

Thanks for the help!!

(BTW, this section of the book mentions a familiar name to readers of these groups... N6BIS, Patty Winter! Okay, Patty... help!!!!!)

We also made QRZ at W6YX. We have third party confirmation. But, given the Doppler, one could make an actual connect only at maximum elevation (at least at our latitude), and since the robot heard us before that time, there was no way we could ACK it.

The robot is the proverbial Good Idea, since it allows for continuous coverage (even while the ham astronaut is doing real work). But yeah, the logger could use a little bit of work...

Could someone send me the circuit for the ROBOCOPY program that
was published in the October issue of _73_ Magazine. I have

the program which is intended to decode cw from the reciever
speaker input, but don't have the circuit schematic. I will also
need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

I've recently started using KA9Q's NET software. My KAM (3.01 firmware)
is now in KISS mode and the LED's don't have the same meaning.

About all I can positively conclude is that XMIT remains XMIT and RCV
remains RCV/DCD. CON and STA blink during a RCV, so I assume they're
maybe protocol identifiers.

I can't find the answer in the manuals and the Kantronics tech support
line is busy, busy, busy.

Any definitive answers?

In my last post I was looking for KA9Q's software for SCO Xenix. I never
found a Xenix specific, but was able to compile the 890421.1a version of
NET with little change. This was a great accomplishment for a non C
programmer like myself. (toot toot) I have also established a SLIP link
to my MS-DOS PC. It works, but I still have a *lot* to learn.

Could someone advise me of possible problems I will encounter with NET?

>do some processing to make it good. ...

I would be happy with something much simpler. Why can't I set my TNC to
monitor a channel and display every packet, whether the CRC checks or not?
In other words, go ahead and print the corrupted packets. You would still
be able to make out part of the message. (Wouldn't you?)

This would be like the old days of Baudot RTTY where a static crash might
take out a word or two, but you could still understand the gist of the
message.

YOU might be able to decipher it, but if the TNC can't, it can't
acknowledge the packet and the sender will resend it anyway, so
why use packet if all you want is the poor reliability of rtty?

But if you want to, just turn PASSALL on. Most TNCs will cheerfully
deliver garbage if you ask them.

BJ--

The public service column of the December _QST_ is devoted to ARES/Data.
It gives instructions on how to obtain it by mail, CompuServe, or BBS.

By the way, someone once pointed out to me that the terms "copyrighted"
and "public domain" are mutually exclusive. Like Phil Karn's NET and
NOS programs, ARES/Data is free to its intended audience, but is not
public domain.

>Also, it book mentions that to use the ARES/Data program, you need the

The article mentions that TAPR sells these EPROMS.

What did they do--reprint my "Packet in Emergency Communications" article
again? I know they used it in the _Public Service Handbook_ at least once.

Patty

p.s. Don't anyone bother asking me more about ARES/Data. I've seen it
once or twice but otherwise know nothing about it. It runs on the wrong
computers. :-) :-)

Well, I went by what the book written by Stan Horzepa (WA1LOU) said:

"It [ARES/Data] is a copyrighted, public-domain program, available
without charge to anyone interested."

Personally, I agree with your statement, but I wasn't sure if it was
truly copyrighted or really public-domain, so I went for inaccurately
vague mode :-)

>
>>Also, it book mentions that to use the ARES/Data program, you need the

Someone else pointed out to me that this was NET/ROM... I remember when
that was first coming out, but I haven't used it much. (Unfortunately,
I haven't been active in packet for a while... I see all that's happend
and it's overwhelming!)

>
>>(BTW, this section of the book mentions a familiar name to readers of

Well, the book mentions "a set of... packet-radio guidelines and public-
service events were compiled by Patty Winter, N6BIS, in 1986... An
expanded version of these quidelines follows." Then it goes into what
would be a little over two pages worth of hints and guidelines. It was
very informative.

Overall, I really like the book. BTW, this is the 2nd edition to which
I refer...

>

Ah, there's nothing like loyalty to one's company!! Personally, all the
modern day machines seem the same to me... [enter old-fart mode] I
remember back in '05 when we had to boot the machine up with the
switches on the front, and load in paper tape... and we LIKED it that
way! (mega- :-))

Thanks for the help, Patty!

This would work to the extent that you want it to, but it is counter to the
overall philosophy of packet radio, specifically the concept of reliable
delivery.

If your definition of packet radio is interactively qso'ing or "reading the
mail", then this may be a good thing to be able to do. If your definition
of packet radio is more like mine, doing lots of sophisticated computer to
computer communications in support of qualitatively different applications
than keyboard to keyboard or keyboard to bbs operation... then you really do
want to drop packets with errors as soon as the error is detected, to
minimize the impact on system resources of processing trashed packets.

So, once again, the answer is both yes and no.

Bdale

It would be worthwhile if someone could upload ARES/Data to a well-known
archive site. People would then be able to get it via anonymous ftp.

If this has been done, which host has it?

My TNC (KPC-2) doesn't have PASSALL. Do all TNC-2 clones have this?
What I want to do is be in monitor mode (not connected to anyone) and
see what is going on on the channel.

|> But if you want to, just turn PASSALL on. Most TNCs will cheerfully
|> deliver garbage if you ask them.

Yeah, and you won't believe just how MUCH garbage they'll deliver
until you actually try this. Especially on HF, carrier detect circuits
don't work very well, so most stations end up feeding continuous raw
noise from the receiver into their HDLC chips between each packet.
Most of this stuff is normally filtered out by the CRC check. But a
surprising number of small garbage frames (e.g., < 3 bytes) will make
it past the CRC check. That's because the CRC is only 16 bits wide, so
any random pattern of bits has a 1/65536 chance of being accepted as a
valid frame. Even at 1200 baud, it doesn't take long for this to
happen.

However, these garbage packets are invariably discarded because they
don't have your callsign at the beginning. Consider that the chances
of your callsign appearing by chance in the destination field of a
purely random packet are something like 1 in 2^56. (There are 7 bytes
or 56 bits in an AX.25 address field.) This is a MUCH smaller number
than 1 in 2^16. It's equal to the chance of guessing a 56-bit DES
encryption key - i.e., small enough to not worry about.

Nevertheless, turning off your CRC check in the hopes of getting only
slightly errored frames is not likely to work all that well. Most
real-world errors are bursty (e.g., caused by QRM or static crashes)
so quite a few bits are wiped out. This type of interference almost
always screws up the HDLC bit-stuffing logic, sometimes aborting the
frame entirely (it takes only 7 or more contiguous 1s to cause a frame
abort).

The right way to do bit-level FEC is to switch to an entirely different frame format. The frame should start with a relatively long, pseudo-random "synch vector" instead of the short HDLC "flag" (0x7e). This vector should be long enough that the chances of it occurring in random noise (or user data) is vanishingly small. It should also be chosen such that it can be reliably recognized even when a few of the bits are corrupted in transit without appreciably increasing the chances of a false alarm. Because the synch vector is long, there is no need for bit-stuffing.

The receipt of a synch vector initializes a forward error correction decoder, either of the convolutional (e.g., Viterbi) or block (e.g., Reed-Solomon) type. Bits are clocked from the channel into the decoder, and some smaller number of corrected bits emerge some time later. Burst errors can be handled by interleaving the encoded bits on the channel, e.g., turning a burst of adjacent errors into a more widely distributed pattern of single-bit errors that can be more easily corrected by the decoder.

Many real-world coding schemes make use of both a block and a convolutional code in series. The data is first block coded and then convolutionally coded. The receiver uncodes in reverse order. This highly effective scheme is especially popular in deep space communications (e.g., Voyager).

The 400 bps telemetry on Oscar-13 uses a framing scheme similar to what I just described. The synch vector is 32 bits long. Convolutional coding is available, but it has never been used; normally the links are good enough that it isn't required. In my opinion, the main drawbacks to the Oscar-13 scheme as currently implemented are a) the synch vector isn't long enough, and b) the blocks are of fixed length (512 bytes). These could be readily fixed in any new framing scheme designed specifically for use with bit-level FEC.

>infringments.

I would be quick to point out that the issue of cellular reception
is a weak one indeed. To wit: The Icom IC-R7000, the Yaesu FRG9600
the AOR3000, the AOR2515, the AOR950, the AOR2002 all receive cellular
with no modifications. Admittedly these are all table tops, so here
come the handhelds: The AOR 1000, the AOR 880 the AOR900 and the
Fairmate handhelds all receive cellular.

I have no firsthand knowledge of what the problem is with the R1
availability in the US. I would suggest that the possiblity of
patent infringement litigation seems much more plausible.

I for one, really like my R1 and wholeheartedly recommend them
to anyone who can get their hands on one.

Also to those who would balk at the price of $600: When Grove
enterprises advertised one earlier this year, they had a suggested
price of $599 on it. Considering what you get and what the AOR1000
costs in comparison, it seems fair to me.

>its because I too am in the QRZ and NOT the QSL list after two
>successful connects. I am urging that this be modified for the
>Ken Cameron mission. Comments?

  This was not a small mistake. This was a MAJOR 30 dB error!

  This procedure ensured that operators keep trying even after all reasonable conditions had been met. Fortunately for the QRM, some who believed the published procedures quit when they got the QSO number. They will be penalized for following the instructions and not adding to the QRM.

  There were many published notes that claimed that once you had the number, that was it -- you had a complete contact. Now, after the mission, apparently, they change the rules.

  Even as it was, I have log files showing some stations connecting over and over, and getting lots of different QSO numbers. If the system had worked as advertised, these folks would not have been rewarded for tying up the channel and blocking out the smaller stations.

  Hopefully, people who believed AMSAT in the past will be less willing
to do so in the future.

     Alan

For years I've been trying to tell anyone who will listen that
connected-mode AX.25 is very ill-suited for "contesting" purposes.
Unfortunately, the Sarex missions seem to place a very heavy emphasis
on Joe and Mary HT being able to participate with no special
knowledge, equipment or protocols, even though this wastes a golden
opportunity to encourage Joe and Mary HT to try something new. and
even though this results in absolute bedlam on the bands.

Anyway, what you really want is a simple three-way handshake. Station
A sends a CQ with a sequence number. Station B responds by acking the
Station A's transmission and including a sequence number of its own.
Station A then acknowledges station B's transmission and goes back to
calling CQ. That's it!

There is, by the way, NO protocol that will *always* ensure that two
stations communicating over a lossy network will agree on whether or
not they had a successful QSO. This is known as the "two-army
problem" (aka the "coordinating generals' problem") and it is easily
shown to have no solution. See Computer Networks by Tanenbaum,
second edition, p397-398.

Could someone send me the circuit for the ROBOCOPY program that
was published in the October issue of _73_ Magazine. I have
the program which is intended to decode cw from the reciever
speaker input, but don't have the circuit schematic. I will also
need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

In article <8@ipars.UUCP>, scotto@ipars.cts.com (Scott O'Connell) asks
about the CON and STA lights when operating his KAM in KISS mode.

The general convention for these lights (originally established by
K3MC in his KISS implementation for the TNC-2) is that STA flashes
whenever the TNC receives a frame from the host for transmission, and
CON flashes whenever the TNC correctly receives a frame from the
radio.

These two lights are under software control, so it's possible that
Kantronics has implemented them differently. However, from your
description it sounds like they followed the original convention.

We know nothing about Packet Radio at all, but we are connected to the IP. We
think that Packet Radion could be a real boon to our remote learning programs
as cooms lines in our part of the world are rare and expensive.

The problem is how do we start ??

Would someone mail us directly with some suggestions on books, publications,
FTP sites etc that could give us a start.

We have done some work with using KA9Q etc as a router between AppleTalk and
ethernet so we are aware of and sort of comfortable with TCP/IP but the packet
radio side is all new.

In addition I believe that there is a mailing list called

     packet-radio@ucsd.edu

anyone advise me on how to subscibe.

All help and suggestions gratefully received.

Whilst trying to clean up the incredible mess/mesh that the SoCal
net/rom network is the other night, I ran into a problem that hadn't
occured to me before.

There are several nodes on the network with multiple ports - ie, a
G8BPQ switch with radios on 145.01 and 223.42. Both of those ports are
currently assigned the same callsign-ssid and nodename.

There are also several other nodes around the area that are on those
frequencies, but they each have different call-ssid and nodenames.

The confusion comes when trying to assign quality values to the various
paths. It's not possible to tell node A that XXX-1 on 145.01 is a
different beast than XXX-1 on 223.42, and the same for node B, yet
because both node A and node B can also talk to each other over another
link, they both think they have prime quality RF routes to XXX-1,
although because the 223.42 channel is backbone, we want to direct all
the traffic to there rather than to 145.01. I can't lock out XXX-1 on
node A on 145.01, because that marks the route bad even through node B.
Not only that, but the actual case is a FIVE-PORT bbs here in town
that's on just about every packet channel there is, or so it seems.
Routes to it just keep swapping around as the nodes broadcasts happen,
and nobody seems to know what talks to where anymore.

ARRRGGHH! It's pretty clear to me that it is MANDATORY that multiport
nodes that don't exist in isolation MUST have different nodenames and

call-ssid on each port, or the poor little net/rom routing algorithm
gets incredibly confused.

Am *I* confused, is this obvious to even the most casual observer, or
what? Comments, please!

     - Brian

(And no smart-guy remarks about net/rom. It's not MY choice.)

This is to the person looking for help on initializing an 8530
board with the scc driver - my mail to you bounced, so I am
forced to post this:

If A0 is tied to D/C and A1 is tied to A/B then:

  Channel A Control = 302
  Channel A Data = 303
  Channel B Control = 300
  Channel B Data = 301

The initialization line should be:

attach scc 1 init 300 16 2 0 1 3 p7158913
scc 0 ax25 lta 512 1200 256

You might want to try mtu of 576 instead of 512.

Let me know if this works for you. There is a documentation file
for the driver that I can send if you don't have it.

Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
or is it for the average ham?

Joe and Mary HT aren't going to be interested in buying new gear (a PSK
modem, for example, 1- isn't cheap, and 2- is a pain to get running) or
learning new software in order to be able to work the shuttle. Instead,
they'll complain loud and long about how those nasty AMSAT types aren't
interested in them, and, unlike the loud complaints about the low-
inclination orbits and Ron's operating hours, they'll have some basis in
fact.

You're right about the two-army problem, but the solution is not to exclude
the average ham.

Just a quick question, has anybody set up a system to allow connections on

a TNC to be directed to aserial port on a Unix box, with a login(1) running
on the port?

To be more specific, I have:

     an AEA PK-88 TNC, 2m rig
     a standalone Unix box, with a spare serial port.

I'd like:

     people connecting to my TNC to get a login: prompt
     not to use KA9Q or TCP [this is in fact Minix]
     multiple connections would be nice :-)

Initially, there will be a guest account with a restricted
environment & no password, so password transmission will not be a
worry.

I guess login(1) would need some rewriting to handle this. Has anybody
tried this, and what were their results? I don't want to reinvent the
wheel :-)

Thanks in advance,

Hi there!

for a practical job here at the university I need all the info I can
get about the precise description of the AX25 protocol. Where can I
find it, get it (and if it's not available for nothing, how much
does it cost)?
Can anyone also give me the address for the mailing list which was

meant especially for people developing software for the packet-scene?
Thanks very much in advance!

Kepler is not the really humbling example in celestial mechanics. That
honor goes to Isaac Newton, not much later. After deducing that gravity
followed an inverse square law, he explored the consequences of that
(including deriving Kepler's Laws) so thoroughly that the greatest
mathematicians of the next two centuries basically just added footnotes
to his work.

Newton certainly killed the 2-body gravitational problem, but many
aspects of the many-body problem were better understood 200 years
after his death than at his death. In particular, while it took
more than 200 years to come up with the modern theory of stability,
200 years of perturbation theory revealed enough to make it plausible that
the solar system could be stable for billions of years
without invoking the hand of God to fix things up.

I'm new to the packet radio scene and have a few too simple questions.

1. How do I get the KAM (It's the all mode Kamtronics TNC) to "talk"
   to the computer?
     I'm using Procomm+ as the terminal program on an IBM computer.
     All cables are correct. I just never recieve a message from the TNC.
     According to the book it should send the cmd: prompt when I turn it
     on and the program is started.
2. The options in the procomm+ program are too numourous to test one by
   one. What are the settings that should be used to start the TNC up?

 Is anyone out there familiar with procomm+ as a terminal program or
 does anyone have a suggestion on another program to use?

 The setup is an IBM computer with a monochrome monitor, a hard drive,
 one floppy drive, one serial port, and one parallel port.

Any help would be GREATLY appreciated.

|> wheel :-)
|>

Many moons ago back when I was just a kid in College (i.e. in '85 :),
I had a similar setup between a Sun 2 at the Physics Department (where I
worked/hacked) and a TNC/terminal at home. I was originally running a
GLB PK1 (gag!) on both ends, later migrating to the more elaborate TNC2
(snicker!). In short, I wrote a homebrew BBS program (which shall live in
infamy in Eastern Washington :) that provided an interface to /bin/login
through the BSD pseudo terminal inteface (i.e. ptys). It was quite simple
and very effective. A process simply monitored the tty port for connections,
then setup a data handling link between the port and /bin/login via a pty.
Adding additional `channels' was possible with the streams interface on later
versions of the TNC 2 firmware.

Of course, as you mentioned, passwords are an issue. I had a restricted
account for entry into the system; if I wanted to su as a more powerful

user (e.g. root), I used a challenge-reply authentication scheme using
a random seed for a polynomial. Of course, there weren't all that many people
on packet at that time so an elaborate system wasn't really needed.

Writing a very simple interface should be trivial. I don't recall if minix
has pseudo terminals; even so, you could probably write something using
pipes.

Good luck and enjoy! That's what it's all about!

There are many books written on the subject of Amateur Packet Radio including
a Radio Shack version and an American Radio relay League version. The AX.25
info is probably also in the latest editions of the ARRL Handbook for the
Radio Amateur. The ARRL is in Newington, CT (I don't have their address here).

Hi folks,

I just got a PK232 to add to my SWL setup, and I'd like pointers to software for displaying fax & RTTY stuff and/or controling the beast. The controlling computer is an old sun, so source code pointers would be appreciated, although any tips at all are welcome. Also, if anyone has written code for controling a Kenwood R5000 they'd be willing to share, I'd be interested.

If I don't hear from anyone, I'll post again when I've written it all :-).

BTW, I tried looking at the hamradio/packet directory of the ucsd.edu anonymous ftp site, and there are two files pk232.arc and pk232-com.arc, but they are both unreadable by the public. Any idea what they are and why they are unreadable?

Thanks,

Larry

I`am happy to anounce, that you now can get the best and most used
packet radio program, from iesd.auc.dk (130.225.48.4)
as anonymous ftp.

The program is placed at
/pub/ham-radio
And the name is
pcmb510.lzh

If you use it please E-mail, to me so that we can send you information
about neu things....or developments of this fine program..

There is also developt a remote contole program to Kenwood radio`s
but there is not English docomentation..... but it will come

Hallo Welcome to PCMBOX.

*** PCMBOX Copyright (c) 1990 OZ1HMN ***

What is PCMBOX ????

PCMBOX is a Packet terminal program with many features including mini mailbox,
21 commands based on the // principle.

PCMBOX is written in Turbo Pascal(tm) by OZ1HMN and is a shareware program
fully Copyrigthed by OZ1HMN. It is forbidden to sell and may not be used
to any commersial purposes.

Now some of the features:

Yapp is supported in terminal as well as in mailbox mode.

A log is updated every time you connect someone, and a seperate log file for mailbox users.

You can call an External program within PCMBOX.

You can connect via the routing list (Alt-C).

Setup of your favorit editor.

Setup of your favorit viewer.

Create a mail file within PCMBOX.

RX buffer containing op to 400 lines.

Trace (look for) specific text received, and then beep.

And now a dump of the 3 help screens:

```

Concerning solar system stability, it must be conceded that this is not a completely solved problem.

Perturbation theory techniques are the traditional way to evaluate this problem. However, use of them depends on dropping higher-order terms, and there is the problem of how much these contribute to the final results. In particular, if there is a near-commensurability in some of the orbit periods, then that will magnify the effect of whatever terms in which it causes a near-cancellation of the rate of change. Example: if there are two objects, 1 and 2, of which object 1 has a mean angular velocity twice that of object 2, then terms containing expressions like:

l1 - 2*l2

where l1 and l2 are the mean longitudes of the two objects, will change slowly and may even produce big oscillations in l1 and l2.

Since most perturbation-theory analyses ultimately involve averaging over orbit positions, resonance terms like the example

mentioned above are a serious difficulty, unless they can be identified.

Even in that case, one may approach the limits of analytical tractability, and have to resort to numerical integration, which can be done directly on the coordinates of the objects. I note that orbit elements can be thought of as "coordinates" in this context, though their equations of motion are more complicated than the equations of motion for positions and velocities.

Direct integration of the positions and velocities also has the advantage of keeping all the terms, as it were, as opposed to doing integration for the orbit elements with a truncated perturbation series, due to the missing-term problem. However, integrating orbit elements can cover a much longer time range for a truncated perturbation series, because the orbit-variation timescale is usually much greater than the orbit periods.

Actual results? It appears that some of the objects in the Solar System move chaotically. Saturn's satellite Hyperion is known to tumble chaotically, for instance. And numerically integrating Pluto's orbit reveals it to change chaotically. There is even evidence for chaos in the motions of the four big planets -- Jupiter, Saturn, Uranus, and Neptune. However, the "size" of the region of chaos is still uncertain. If it turns out to be small, then the motions of the planets are predictable within that region, and it may even be that the Solar System is stable over timescales of billions of years despite the weak chaos in the motions of the planets. More research on this question will certainly be needed.

I started thinking last night... (dangerous!).
Has anyone tried using full-duplex packet (split-frequency working?) like
outbound on 2 meters, inbound on 440 ??
Of course to make full use of this, would require some smart code, but
consider the following:

Stations 'A' and 'B' are both working into station 'X'.
A cannot hear B, and B cannot hear A, so neither A nor B realise they are
colliding with each other (familiar scene is it not?)

Now if station 'X' could, on hearing a collision start to happen,
immediately, on another frequency, send an 'indication to abort'
to both 'A' and 'B', then both 'A' and 'B' could immediately stop
their transmissions and go about retrying later...

(This means that 'A' and 'B' must be able to abort a frame that is
already in transmission, rather than completing the transmission of the
whole frame).

It would also mean that, with suitable windowing, the transmission
of bulk data would be MUCH faster (no need to wait, you send the
frame-acknowledges back down the other channel.....)

 Am I having good ideas here, or should I go sit under a toadstool?

 Pete Lucas G6WBJ   G6WBJ@GB7SDN.GBR.EU   PJML@UK.AC.NWL.IA

I didn't say that nothing was added for 200 years, only that what was
added was incremental improvements and refinements of his work, rather
than anything new and major.

According do the guy who taught the packet class I took (wb2kmy),
some backbone point to point links are using crossband full duplex.

If you are primarily concerned with hidden transmitter collisions,
what you could do is have your mountain top network node transmit a
"channel busy" signal on another frequency/band. Since this could be
just an on/off carrier (hmm. what about ID?), you could pack dozens in
the space that would be required by a normal data channel. It would
help to have equipment that supports real short txdelays (and of
course, a random wait) to cut down the problem of 2 users starting at
the same time.

Seen in Usenet newsgroup sci.space.celmech.history, 6 Dec 2000001990:

     The adjudicating committee appointed last year has regretfully
     announced that the Two Billion Year Bet has had to be called off.
     The pizza was good, but everyone had to buy their own beers.
     (The management did, however, agree to a special rate, only

$6945/liter for an excellent import from Heidelberg IV. The
local branches of the major US brewers offered to provide beer
free, but everyone naturally ignored them.) Citing impossible
difficulties in deciding whether the solar system would have
been stable if left alone, the committee concluded that no
settlement of the bet was possible. "Moving Venus and Mercury
out was not that big a deal, and we think we could have allowed
for that, but the Arts Council grant of 3476876 for rearranging
the asteroids into aesthetically pleasing formations by modulating
the orbit of Jupiter just caused hopeless confusion, and when the
Flat Ecliptic Society started tidying the orbits up in preparation
for the Galactic Fair of 78654379, well, that was the last straw.
Not even the generous donation of five milliseconds of Cray-94673
time by UUNET Intergalactic Communications Inc was sufficient to
decide what would have happened if the upkeep of the solar system
had been neglected for so long."

How about rec.radio.amateur.policy?

My only objection to the new newsgroup is that it has all the earmarks of sticking one's head in the sand rather than coming to grips with the fact that when ham radio dies (and it probably will) it will be for political reasons. We ignore that side of the hobby at our peril.

The technoids go on and on wonderfully about their ideas for the design of the Phantasmagorical Data Engine with the blind faith assumption that when they're done, we'll have amateur bands to use it in. I don't think we can assume that, and sticking those who write about it in a "newsghetto" so they can be ignored more easily will be counterproductive in the long run. Penny wise and pound foolish, as it were.

is there a tower that will come down (automatic) when the winds
go above say 50 mph. then go backup when the winds decrease.

if there is, where can i get one, and (the normal question) how much.

I am intending to implement a TNC using an Intel 83C152. This chip has an
on board serial interface which supports SDLC. I have a copy of the AX25
protocol spec but if refers to another document for the CRC polynomial,
therefor could someone please post the polynomial used in AX25 so that I
can check if the 83C152's CRC polynomial is correct,

    thanks,

Hi,
Does wnyone know ehere I can get the specification for the X.25 links between
ROSE nodes. I am interested in putting code similar to the NET/ROM code
into NOS for ROSE.

Unfortunately we have both ROSE and NET/ROM networks going in locally
and I would like to gateway between the two.

Carl,
     I can not only supply you with a reference to the specification
for the ROSE Packet Layer Protocol (see Summary line above), but I can
also provide you with source code in very portable "C" which could make
your work much simpler. The source code is the same "PROTOCOL" code as
is running today in the ROSE X.25 Switches. Tom, W2VY provided RATS
(The Radio Amateur Telecommunications Society) with a complete set of
source code for the ROSE X.25 Switch as of 10/13/88. I must emphasize
that his changes in the current software release are in the "SWITCH"
and "APPLICATION" modules, not the "PROTOCOL" module.
Please contact me via email or preferably telephone. I can provide
the access information so that you can download the software when we
talk.

BTW: Anyone else interested please feel free to call.

     Thnx to all out there that replied to my request for help on the

KAM. Your combined help got the the KAM to work. For some unknown reason
the computer thought that the serial port was COM2 and that COM1 didn't
exist. So I swicthed to COM2 and wham! just like you said it came up with
the KAMTRONICS message and cmd: prompt.
   I spent about 6 hours last night playing with it and am very pleased.
THANK YOU for all your help and thank you to this news group for being
in existance to help me.

  Fine, so why did you have to post this message plus 5 parts of the actual
  program? Posting to all of the above list of newsgroups seems like a bit
  of overkill. In the future please post only the announcement and send the
  files by e-mail or post in a binary newsgroup. Not everyone needs or wants
  your software that reads these newsgroups, not to mention soem of us have
  computers that use other operating systems (Like AmigaDOS).

Pete,

Yes, this idea occurred to me several years ago. Using a split
frequency repeater (preferably crossband) makes it possible to provide
true collision detection in the Ethernet sense over packet radio.

This is not possible on regular simplex packet radio because of the
enormous disparity between the transmit and receive signal levels
(the reflection of your signal off the sidewalk is probably far
stronger than the signals from the other stations you talk with).

Ethernet owes its stability to its ability to detect collisions
quickly and abort them, before the stations involved have wasted much
time on the channel. The same should work well on radio as long as
the propagation delays are short (i.e., on local terrestrial paths,
not satellite paths).

Phil

I agree with Henry. Newton humbles us all. As for the following 370 years of
many-body perturbation and stability theory: bah! "plausible" and "could be"
are waffle-words. How can this billions of years stability stuff be science
if you can't test the result of the theory? Meet me in two billion years
for pizza. If it turned out that the solar system WAS stable, i'll buy you
a beer.

No, the material in the 7th Computer Networking Conference Proceedings is
not the standard. That information is about proposed changes. The
actual changes adopted differ somewhat from what is published in the
7th CNC. The new version isn't yet published, and until it is version
2.0 of AX.25 remains the official ARRL standard.

-I'd like people connecting to my TNC to get a login: prompt not to use KA9Q
-or TCP [this is in fact Minix] multiple connections would be nice :-)
-Initially, there will be a guest account with a restricted
-environment & no password, so password transmission will not be a
-worry.

Yes, it has been done. A friend of mine, ka2qhd, runs a unix bbs here in
central (New) Jersey that does just that. Note that you might want to put
the tnc in transparent mode, and enable the periodic timer that sends packets
every second or so, even if there hasn't been a <cr> sent. This allows things
like vi and the shell to output non-<cr> terminated lines. (Like your prompt.)
Another thing - if your TNC has DCDCONN, use it. This will cause the users
session to be aborted if they forget to log out and just disconnect. This
command causes the DCD line on the tnc/computer connection to follow the state
of the connection. You may have to tell login() or getty() to listen to DCD.

Multiple connections are possible when running ka9q on a unix system with
pseudo ttys. (ttyp0...vtty0). Note that ka9q can be run in the background -
you don't need to tie up the machine with just net. You can also have the
xobbs running at the same time, and allow simultaneous telnet logins, ftp
sessions, and bbs connections. Pretty powerful! Good luck, see ya on the air!
If you'd like more details, send me email at davet@tsdiag.ccur.com.

It will arrive truncated at some sites, and it won't appear in the
digest at all. Nothing over 500 lines long does.

Look, dudes, the proper way to distribute software is to put it out
where people who want it can grab it, not to send it to thousands of
sites in the hope that one out of a hundred may care about it.

Anonymous UUCP and FTP, plus telephone BBSs do this well.

Greetings,

Sorry if this has been asked a million times, but I'm new to this list
and to Packet Radio. I live in Stuttgart, Germany, and I've already
sent off for my "DA" license (i.e. an American military license for
operating in Germany). While I'm waiting for my ticket, I'd like to ask
a few questions about packet radio.

Specifically:

a. What type of packet activity is there in Southern
Germany? I'm specifically interested in TCP/IP and
internetworking.

b. The only rig I have is an ICOM 735. Are there any problems
using this radio with a TNC? Additionally, what type of
TNC is best for HF packet work.

c. Is there a Packet Radio Club in Southern Germany? I'll
probably need some help getting started.

d. Finally, is there any packet activity with MARS? I'm in the
military, but there isn't a MARS station at my base yet.
Maybe I could get something started.

Thanks in advance,

WB1BQF

How is one supposed to detect the collision using AFSK? Won't it in
most cases be impossible to determine if there has been a collision
unless the checksum test has failed?
Busy Tone Multiple Access, BTMA, is easier to implement and probably
more efficient since the collsions are avoided rather than detected.
A drawback with BTMA is that the capture effect in the receivers may
cause one to defer from transmitting when it isn't really necessary.

I just got started in packet and have an MFJ 1278 and an old mac (512K).

does anyone have any software that i can use?

I am currently using a terminal program but this won't allow me to 'play'
with fax sstv etc. I would also like something to use the mac to run the
mailbox and such since it is more powerful that the 1278.

thanks

>unless the checksum test has failed?

Please clarify that effect for me. As I see it, and I may be wrong,
a FDX repeater allows the node to hear what it's transmitting. True,
it's not like Ethernet where collision = 6V instead of 3V. So you
may have to wait to hear the checksum to know that collision didn't
occur. Thus it doesn't really pass the "CD" test for "CSMA/CD".

But it does do away with Hidden Transmitter Syndrome, within the
limits imposed by propagation delays (300km/s). So you do have carrier
sense, making collision MUCH less likely. And if you do have collision,

and capture occurs, then at least that party gets its packet through,
something you don't get on Ethernet.

If the sending node had some kind of comparator for received-bits and
transmitted-bits, taking the turnaround delay into acount, then
CSMA/CD might be essentially possible. But it would not be trivial
to implement, and would be needed at every end node. Offhand, then,
I'd say straight CSMA (listen before transmitting, FDX repeater) is
about the best we're likely to get for a while for "access" users.

Since the present HTS-laden channels are barely Aloha quality,
CSMA would probably deliver MORE THAN TWICE the throughput than
we get now, using only twice the bandwidth, so our bandwidth efficiency
would go UP by using repeaters. Of course the FM yakkers who pretend to
be spectrum managers often make this difficult, but we had that flame
war last year on this newsgroup so I needn't raise it again.

>therefor could someone please post the polynomial used in AX25 so that I
>can check if the 83C152's CRC polynomial is correct,

I find this practice of leaving out things that can be explained without
a great deal of text, especially in a publication not (formally) intended
for engineers and professors, disgusting.

It would have been trivial to simply give the binary value for the
polynomial in the text of AX25. I also believe it would not have been

that much more text to explain how it works. This explaination would
be better in a tutorial on packet, but it definitely belongs somewhere.

Of course you can't get entirely away from making some subtle references
to other technology. But when it is necessary to expressly make such a
reference, consideration should always be made as to the worth of using
full text instead of a reference.

Whenever any publication does make critical references such as the case
with the AX25 CRC polynomial, there should be included an appendix that
explains where to get the necessary publication and including its price
as of the date of publication of the reference.

I'm not arguing against changing the name, but at the same time I think you
underestimate the degree to which 'radio ham' has over the decades become a
widely understood term among non-hams.

I'm not arguing with the logic of the mechanics. I'm arguing against the
attitude that produced the desire for the new mechanics. I believe that it is
dangerous to believe that ignoring the very real political problems we face
will make them go away.

>I agree with Henry. Newton humbles us all. As for the following 370 years of
>many-body perturbation and stability theory: bah! "plausible" and "could be"
>are waffle-words.

   While I will agree that Newton established all the fundamentals for
the CM, that he did grind the 2-body problem to dust, and that the
science of CM is indeed four centuries old, I cannot agree to calling
the later work "footnotes" or dismissing the following works as being
un-verifiable.
   This argument is similar to one that may be made in "showing" that
all of science and engineering boils down to Physics, or that the only
truly original discoveries appear in some esoteric branches of
Physics, and everything else follows.
   The point is not that the basic problem of CM has remained unchanged
for the past four centuries. It is that all the variations on that
problem have prompted some remarkable contributions from a large number
of mathematicians, and more importantly, these contributions have had
implications far beyond just CM.

I heard about Ham Radio from a couple of my friends, and i'm started to get
interested in it. Can someone send me mail explaining ham radio and packet
in general? I'm not very knowlegable about ham so any info would be great!
Thanks.

-Fred

You point out that the term "radio ham" is understood by a growing
majority of non-amateur's. However this doesn't indicate the
connotations many non-operators associate with the term "radio ham".

In my experience, this term has no redeemable value with most

"non-hams". In fact I would argue the connotations are so negative
that we should do anything and everything we can to move to a more
neutral term, and to dispell the negative connotations associated with
Amateur Radio.

I think that the degree of "understanding" the average layman has of
the term "radio ham" is the precise reason why we should adopt the
term "amateur".

I suspect that at one time people would have argued the term "amateur"
had negative connotations. I doubt many sane people would do so now.

          =-=

While I'm here, I'd like to also state that I favor the following two names:

     rec.radio.amateur.digital   (to replace rec.ham-radio.packet)
     rec.radio.amateur.regs   (instead of r.r.a.legal)

Hello World

Here is again a great program, witch my friend Lars have made. You
can get it by anonymous ftp from:

iesd.auc.dk (130.225.38.4)

username: ftp or anonymous
password: our username..

Filename: tsrem.exe and this text tsrem.txt
path   : /pub/ham-radio

Lars is soon going to make a new version of this program, so if you
out there E-mail me inprovement I'am soure Lars will be happy.

God lock and a happy chrismas

Peter Sunesen

GREAT - LOOK HERE - Some news for TS440 owners.

>>> TSRem Copyright (c) 1990 by ARCOSOFT - Lars Rasmussen <<<

TSRem is shareware an may not be used to any commercial purposes.

TSRem is capable of remote controle your TS440 from the PC via
one seriel port (COM1-4). Working all in text mode. No graphics.

On the normal program screen you have the following informations:

Contents of VFO A.
Contents of VFO B.
Contents of a group of 10 M. CH. with a comment to every M.CH.
All the informations in the TS440 display including RX and
TX frequency at the same time.
Mode of modulation.
Steprate 10 Hz - 1 MHz.

TSRem has 2 ways of operation:

1) Status display for TS440 settings. While you control TS440
   in the normal way, by twisting knobs and so on, the PC
   displays updated info 1 sec. after you have pushed a button.

2) Remote control of TS440. Control the TS440 from the PC's
   keyboard. The force of the program.

Memory channels.

You can write a comment of 28 chr. to every memory channel.
Save memory contents to a disk file.

Load disk file into memory.
Print the memory file to the printer on LPT1.

It takes no more than 10 sec. to load or save a file, including reading or programming the memory in TS440. You can then have eg. a memory file for every operating mode, 100 memories for FAX or CW, or 100 memories for every band you will work on.

Furthermore:

Built in scanner. Scans the programmed M.CH. in 3 speeds.
Built in HELP menu.
It's possible to switch between COM1 to COM4 in TSRem.
Selectable IRQ for COM3 and COM4.

At the moment there is no English manual, but thats one of the first improvements to come.

If yoy find this program of any interrest, please send a donnation to:

Dunno about the HAPN card. The PC-100 is a product of PacComm.

>Also, where can a non-ftp site obtain the lastest source for
>NOS? Anything available via uucp? What happened to uucp site
>"winfree" as described in the doc that came with KA9Q NET?

The machine 'winfree' is my personal unix machine at home. At one time it
ran a BBS and provided anonymous uucp access, but the work for me to maintain
the service ceased to be acceptable, so I stopped.

I agree!!

And I have put it up for anonymous FTP at platypus.uofs.edu in pub/HAM-RADIO.

There are other goodies there also (even for MAC Users ;-) so feel free to
look around. I also hope to have a phone line (only 1200 baud though :-( )
shortly and plan on offering anonymous UUCP as well.

I have limited space but will consider adding things of general interest
to Amateur Radio.

Just send me Email.

Enjoy.

I assume you want the name or the like of the CRC, not a tutorial on what
a CRC is. If so, the answer is simple: AX.25 uses the same one that
LAPB uses, which is generally known as "CRC-CCITT".

Here is what telemetry from the DOVE-1 spacecraft looks like once it's been decoded. Calculations applied to the raw telemetry frame are based on calibration equations labeled "Rev 1":

DOVE-1 Telemetry Analysis by KD2BD

DOVE-1/OSCAR-17 Raw Telemetry Display

```
DOVE-1>TIME-1:

[56]	+Z Array Temp	-3.63	Deg. C

Note that the spacecraft was in eclipse when this telemetry sample was taken
(actual location was off the east coast of New Jersey). Also note that the
24-hour UTC clock is one hour slow.

By the way, the software that performed this telemetry analysis was written
in 'C' and was compiled and run on a Commodore 64 computer (!!).

O.K. I've read the FAQ posting. I've read all the messages in the group. I've looked for other groups that might better apply. And I still don't know anything. Would one of you kind people out there take the time to summarize for me the choices I have in fast packet radio?

I am a long-time UNIX user who is about to be financially in a position to purchase my own workstation for home use. Unfortunatly, I have become addicted to good net.access, so now I am looking for ways to connect the home machine to the work network. SLIP or PPP come to mind as software adaptations suitable for running over a modem, but 2400 baud just doesn't cut it.

Ultimatly I am looking for a single workstation's share of an ethernet, i.e. about 1 Mbits/second, but I realize the notion of shoving this through a voice line is hopeless. I saw a posting earlier mentioning a modem that is perhaps more reasonable, at 5Kbits/second. If this modem could be used on a plain Bell line, and it didn't cost many thousands of dollars for a pair, I would be overjoyed.

In general, I am taking the long view of all this. I will be wanting conectivity from now onwards. ISDN isn't going to get to my doorstep for at least another 10 years. If these sorts of modems need the sorts of bandwidth I think they do, radio in some form is the only reasonable solution. I have a reasonable hardware background, and would be willing to get whatever liscenses it would take to run this sort of setup. Getting a ham liscense might even be the key to picking up what remaining electrical engineering I am interested in learning.

Please note that I explicitly not interested in: re-inventing multitasking, virtual memory, a TCP/IP protocol stack, TCP/IP clients, net access for the budgetarily challenged, or anything else having to do with underpowered, OS-crippled MS-DOS machines. On the other hand, I am perfectly willing to share what I learn and build with the net and anyone else who is interested.

Very interesting: then what was that bright orange spot I've seen recently
from Germany? If NASA wants to go to Mars, and if it wants to go alone, it's
o.k. - but do they then have to restrict its visibility :-) ?

Except for Antarctica, of course, Mars is visible these days at 8 p.m. local
time around the globe.

Since you ask...
     97.115(b) The third party may participate in stating the
                  message where:
                    (1) The control operator is present at the control
                        point and is continuously monitoring and
                        supervising the third party's participation...

Note the use of the word "continuously." That means the control op must review (monitor) *all* of the third-party communications, not just some portion thereof marked mechanically.

They expect a good-faith effort to follow the rules, not to (mis)interpret them to "allow" us to do whatever we damn please.

A Telebit Trailblazer can run 9600 baud over Ma Bell's lines. Of course,
you need another Trailblazer on the other end, but don't you have the
same problem with packet?

The advantage of using common-carrier Ma Bell is that you don't have to
worry about being held responsible for putting alt.sex.pictures out over
the air! :-) :-)

I apologize that this is probably not the interest group to ask this
but...does anyone know where I could get weather satelite pictures
via ftp? I am also interested in decoding satelite data and porting
to my amiga...has anyone done this?
         thanx,
         owen white.

If you want to be able to do work related stuff as well as ham related stuff, your best bet is a pair of 19.2kb Telebit Trailblazers over the twisted pair at $900 each. Or a pair of generic 9.6kb V42bis modems at about $500 each.

Over radio, the 56kb modems output 29Mhz RF in a 70khz bandwidth. You need a transverter to kick them up to a UHF frequency. The modem is $225 and a suitable transverter is in the $160 to $320 range. If you want more info on the Grapes 56k modems, contact KD4NC by email via the bang path of gatech!kd4nc!dug and he will send you info and ordering instructions.

The next step down in radio modems is the 9600 baud G3RUH modem available as a daughter board for the TNC2 from Paccom in Florida. Pricing of a system goes like this: Modem $99, TNC2 $130, radio $449. Some serious shopping can get the radio down in the $300 range. Some serious tinkering can convert a surplus commercial band radio for about $100.

There is experimental work in progress on 1 Mbit links at around 1 Ghz and 10 Mbit links at 10 Ghz. When this becomes available it will be line of sight type links with pricing in the $200 to $500 range (estimate).

So there are at least three ways to go in relatively high speed packet and all are around $500 per station. Note that packet overhead will limit your throughput to less than channel capacity in all cases. The 56kb link acts much like a direct dialup 19.2kb session when telneting and the G3RUH acts like a 2400 dialup line. For file transfers where long packets are the rule, throughput approaches channel capacity.

If you want to do work related things over radio, you can get a commercial license for a point to point link. 9600 baud is the best you will be able to do on a commercial channel however. You could get an experimental license to use the 56kb modems, but there is government paperwork involved. For non-work related things, a ham radio license will let you play with any speed you like as long as you stay in the band (upper UHF). Go for it.

implementation of routing algorithms for packet radio networks.

I need to build a test bed to study the performance of the proposed landmark
routing algorithms.

I need to get in touch with local groups in the state of Maryland especially
Baltimore. I also need to become a certified operator.

Any useful information would be appreciated.

Thank you in advance.

ps. Send mail to abdallah@umbc3.umbc.edu

I'd like to thank the net for the informative responses I've gotten about my TS830. As you recall, I wanted to use the narrow filters in SSB mode. Well, this weekend, I got out my schematics. I found out that the filters were indeed switched with diodes, and it turned out to be a fairly straightforward task to break the line from the mode switch to the SSB filter diodes. It turned out that the digital hold switch is a DPDT unit, even though it is only used as an SPST. So I disconnected the digital hold wires and taped them off, and converted the switch to select the 500 HZ filter in SSB mode. If anybody's interested, I will email the gory details...

I found the 500Hz filter very usable for narrow-shift packet. The MFJ1278 has a tuning indicator that shows whether the signal is ON frequency or OFF, to an accuracy of about 10 Hz. So I set that 500Hz filter right on by tuning to a frequency with no signals, and centering the filter noise with the tuning indicator and the IF shift. Of course on a rig without a tuning indicator, this would be pretty hard....

Does anyone have any new EPROM for the TNC220
which has KISS and or MAILBOX .
I have V 1.1.5 and WA8DED EPROM .
Maybe the WA8DED eprom have KISS but it does not work properly.
Can any one helpme.
I make a few mods to the VHF MODEM and its mush more better now.
Any TNC220 user can send me mail for the above.

Not to be posted to the list:

To whom it may concern:

I have been subscribed to the packet-radio list for a long time now. For
some reason, I am missing digests 144-159, 161-189, and 191-199.

Were they mailed to me?

Perhaps I am subscribed as MEYSTMA@DUVM.BITNET - my mail from there is
forwarded to me at encrypt3@bnr.ca

Thank you.

Mike

Try thumper.bellcore.com, in the directory tree pub/ka9q. Phil's bits are in the nos subdirectory, the G1EMM variant is in it's own subdirectory, etc...

Has anyone done anything with the integrated microprocessor and serial I/O chips (like the 68302: 68k core + ISDN style serial I/O, or the Z80181: Z180 core + 1 SCC-style channel)?

These chips (especially the '302) look like a great way to build small, cheap, low-power packet-radio gadgets.

Has anyone investigated using the WA8NLC 3456 mhz transverter as the
RF deck for either the DSY modem (one would need to downconvert the
NLC 144 mHz IF -> 28 mHz) or the FSK section of the N6GN 10 ghz data modem?
The NLC transverter seems like a really nice choice for data, at least
for a microwave neophyte like myself, as it is apparently designed to
plug and chug, ie no tuneups, network analyzer aligned filters, etc.
Down East Microwave sells the kit for $195.

^^^^^ my t2500 runs at 19.2K, Zmodem transfer 1500cps+ (pc was slow)
This does not mean that it will be that fast for network SLIP applications.
You can expect 960 minus over head (lot's for appletalk) using V.32
modem. The reason for this is that Telebit PEP mode is half duplex
(on the phone side) and V.32 is full duplex. The turn around time
on PEP is about the same as V.32 through put.

Getting a deicated Bell set up for 56Kb via lease line is another
way to go. Push them for ISDN and maybe they'll give you a cost
break. By the way ISDN has been Beta tested here. This area is well
on it's way to have ISDN be something real within 1991.

Good Luck

What is the trick to getting E-Mail to a recipient on the ampr.org domain? I have been monitoring the Packet-Radio Digest for the past several months and have yet to see any mention of any Internet gateway. Recently the requirement to reach a colleague (N6BFM) who has a login on W8ZF prompted the search for a means to reach him via the Internet.

A nameserver query for the ampr.org domain returns both UCSD.EDU and THUMPER.BELLCORE.COM and they have records for w8zf-pc.ampr.org, IP address 44.36.8.33. Are w8zf and w8zf-pc one and the same and are they actually nodes on the Internet which should be accessible using the TCP/IP suite? Must one take into consideration some longer propagation delays associated with radio communications as opposed to conventional Internet links when using ping? Are the ampr.org sites listed only accessible by using SMTP, specifying a source route, an E-Mail gateway, or some other technique?

My attempts to mail a message to N6BFM@W8ZF-PC.ampr.org have been bounced with a "w8zf-pc.ampr.org: Network is unreachable" reply on differing occasions. (I had thought there might be some sort of window of availability associated with the ampr.org domain.)

Any assistance in getting an E-Mail correspondence initiated with N6BFM will be most appreciated as will any enlightenment that might be shared on the packet radio network topology in general. Thanks. Take care.

There is no packet gateway between the AMPRNet (network 44) and the rest
of the internet. AMPRNet is not a connected network.

There are a few mail forwarders for a few specific destinations, but
in general, there is currently no way to exchange mail with ampr.org
sites and the internet.

There is a problem in that some people have obtained ampr.org addresses
and then connected their systems using uucp or some other non-IP
protocol, are using the ampr.org hostname in their return addresses,
yet have not set up nor registered a forwarder with the internet.
Thus mail from them reaches the internet via uucp-to-internet gateways,
but there is no path back.

As domain administrator for AMPR.ORG, I am distressed by this turn of
events and try to enlighten people as to what they are doing wrong, but
it continues to occur.

Apologies for your difficulties.

Dave:

It is still in pretty rough shape. We are fixing bugs in it as I write this. We finally have it partially working with AEA tnc's. There is some problem with the way hardware handshaking is done in these units or in everybody elses unit. Also, AEA gives a much higher priority to commands than does anyone else. So when the latest version of the bulletin receiver code puts the TNC into kiss mode, since some of them must be followed by restart command, this is generic to the program. Because of AEA's higher priority to commands (user input really), the TNC stops processing the KISS ON command and immediately gives the foreground over to the new incoming command. When it is done receiving it, it sees that it is the second highest priority command (restart) and restarts the tnc without having EVER put the thing into kiss mode. This needs a 1 second delay added to overcome this problem (much less really but Unix time is given inside in 1 second blocks and is transportable across most systems). We are working as fast as volunteers can.

On DOVE:

Please contact G3ZCZ (lives in Md.) at N4QQ. His What's-Up program is the best in the business for decoding satellite telemetry for many birds INCLUDING DOVE. I strongly recommend it over either the one NK6K or I wrote for the Microsats.

As Brian Kantor will probably tell you, Network 44 is not connected to the
internet. In addition w8zf-pc.ampr.org is a defunct address for W8ZF. You
may be able to get uucp mail to W8ZF via the path ...gatech!kd4nc!w8zf since
Dean has a login on the system kd4nc. There are several Unix systems run by
amateurs in the Atlanta area. Your friend N6BFM may be able to get a login on
one of them.

This is to thank all of the kind people who sent me mail on my question
on connecting my HK232 to an FT-470.

All of the information was very helpful.

My license arrive day before yesterday and the cable was ready and worked
first time.

Thanks..

I am looking for KA9Q's TCP/IP software for SCO Xenix 386 2.3.3 (the
real 2.3.3 via xnx155b) and Development System 2.3.0.

I do not have FTP access. Anon UUCP preferred.

Thanks in advance!

I have had considerable experience with Motrola's 68HC11. It is a
very capable chip. It comes in several configurations. It is
designed as a control processor. It has 2 serial ports, 4 A/D
converters, an extremely sophisticated timer and very low power.
It has up to 512 bytes of RAM and up to 2K of EEPROM on board.
It can run stand alone or it can easily access 64K of RAM.
Motorola has very good support for the 68HC11 including small C
compiler, a basic interpreter, an assembler of course, a real
time operating kernel (all Public Domain) and a bulletin board.
I understand they also have a good C compiler they sell for about
$100.00. The make an evaluation board that cost about $120.00
(half that if you are a student). All you need to run is a +/- 12
and 5 volt power supply (could steal it off your computer and
computer with a serial port and a terminal program. The board has
an onboard monitor called Buffalo that will upload, download
single step, assemble and do all the normal monitor things. Also
included are a good assembler, small C and some other stuff.

This board can be used to make real stuff. I have built several projects including a self filling scale, and CW transmitter, and a very sophisticated timer. We have also built up a board that only uses five volts by using a MAX 232 chip for the rs232 Driver.

Also when you call Motorola you can get real people that know what they are talking about and call back when they say they will.

I am very interested in doing a packet port to the 68HC11 preferably in C. I have a very good C development system at my disposal and need to implement some type of computer to computer radio link for a research project. So I might as well kill two birds with one stone. If any one knows of a C implementation of AX.25 (public domain preferable but other deals are possible) I am sure interested!!!!

We also have developments systems for 68xxx and Intel 8051. IMHO 68HC11 is the far the better choice for the stuff I do, control of agricultural machinery, buildings and food possessing equipment.

I would like to know what software is being used for decoding Dove? Is it

still the program written by nk6k that was distributed shortly after the micro

satellites were launched. Any information would be appreciated.

I Red From Amsat-Uk Oscar News 1990-85 Article Written By K8ka.
I 'am Wondering Where I Can Found Pacsat Protcol Standards Forom internet:
Protocol Suite
Broadcast Protocol
Filetransfer
File header definition
....

It might be that we try to implement some kind of interface to ka9q
software which connects our ka9q based BBS/Netrom node/... to the
satellites.
We have allready made digital part of hardware required in satellite
communications. We call it arti it is 82530 based internal modem card
to pc. It is possible to turn antenna via this board because it has
analog to digital conversion and relay control for 8 relays.

I hope we get information needed. If we start this project you will be
infomed via internet very soon.

I believe somebody's doing a high-end controller based on the 68302, but I've
been looking at the 64180S for use in a TNC or intelligent interface.
I've ported the TNC-2 KISS code to it (and now use it successfully with the KA9Q
s/w
on an Amiga), but it's not really perfect for the ultra-low chip count device I
had
in mind.

The configuration I have uses the 64180S, a static RAM chip, a PROM, a MAX-
something
RS-232 driver, a 7406 to drive PTT, an oscillator package and an SSI package I
use to give me true carrier detect. I'll probably add a DALLAS power control chip

for watchdog, reset and non-volatile RAM support.

The oscillator could be replaced with a crystal, but the package I'm using conveniently generates a clock source for the 7910 modem, and can be arranged to provide a clock for a G3RUH modem. Unfortunately, the division ratios don't suit the TCM3105 modem's clock requirements.

I'm not yet using the DMA controller, since I don't yet need the speed for a mere 1200 baud modem and I just wanted (initially) a near-port of the TNC-2 code. The DMA controller looks truly wonderful, with hardware management of multiple chained buffers.

The on-chip clock recovery conveniently generates a delayed version of the rx clock, so comparing the phase of this with the incoming data provides true-DCD for the price of a 7474 (I use one of the internal timers to count the resulting pulses and provide some filtering).

I've stopped there for a while (while I sort out the NOS and radio stuff a little better), but I'm rather put off developing it as far as I originally intended, because it falls between two stools - it needs too much support for a very low chip-count miniature TNC, and it isn't flexible enough for a multipurpose box like the Data Engine.

The SCC + DMA hardware should be terrific for high speed transfers, but there seems little point when it's limited by the async port connection to the host - traditional KISS problem. Note that the async port isn't supported by DMA. Since there's only one SCC, I can't even take advantage of the transfer rate for a node or repeater with no host access.
This seems a problem with the Kantronics box too - is anyone making use of it's 56kbps capability ?

It's possible I might add a bidirectional parallel port and connect to the host with that, but there are only 2 DMA channels, so I'd have to do the host connection in software (or steal the SCC DMA some of the time).

On the miniaturisation side, the component count isn't as low as I hoped, and promises to rise. There is very little parallel i/o on the 64180S, and it's therefore very hard to control any other parameters - such as modem speed, modem selection, etc. without expanding the chip count. The 7910 makes this particularly tricky due to it's fussy initialization requirements.
This problem seems to me to lose the major advantage of putting the SCC and other peripherals on-chip.

The SCC clocks can only output at the baud rate - so it can't be used to generate a 16x clock as some faster modems require.

Perhaps the ideal use is as an intelligent peripheral card, with shared memory access. The device will support a meg of DRAM with very little hardware, and the serial port might be used for debugging, or to control IIC peripherals (D-A for KA9Q's power-control scheme ??) .
This might best suit a machine with very little space for IO cards, since the space for the PC expansion card doesn't really necessitate a low chip-count

solution. A 56kbps intelligent controller half-card for portables, perhaps ?

This is apparently aimed at voice traffic, but still applys to packet.
So basically you are saying that 98% of all packet boards are illegal.
I doubt the intention of the FCC is to toss us back 10 years, perhaps
that is why most responsible sysops havnt been sited yet. Hmmmm..

A local group here is building a repeater controller using the
8052 Basic uController.

Does anyone have a copy of the October 1988 issue of QEX
that would copy pages 3-9 and 15? This article evidently
describes the use of this device, and is needed to complete
the project.

Any help would be *greatly* appreciated.

I just received this note on packet. It might be of interest to those who own
Uniden 10-meter transceivers and wish to use them on packet and/or AMTOR:

 Msg# TSP Size To   @ BBS From   Date Time Bid
15362 PY   1569 KD2BD   N7ETV 901130 1711
Subject: UNIDEN QSK MODIFICATION

Thanks!!! to Craig, N7ETV for the following info...I will copy this to all
of you who responded to my message.
Mike/KA3NVP

HELLO:
  AFTER HOOKING UP MY HR-2600 TO MY PK-232, I FOUND I HAD SOME PROBLEMS
USING IT IN AMTOR. SINCE I LOVE TO MODIFY AND "FIX" RIGS, I GRABBED MY
TEST EQUIPMENT AND SET OUT TO FIND OUT WHY THERE WAS A LONG SWITCH-OVER
DELAY TIME. AFTER A FEW MINUTES, I FOUND OUT THAT THE RECIEVER WAS COMM-
ING UP OK. IT WAS THE MUTE CIRCUT THAT WAS SLOW. I FOUND TWO CAPACITORS
THAT WERE RESPONSIBLE FOR THE DELAY IN THE MUTE CIRCUT. TO FIX THE PROB-

LEM, CHANGE OUT C74 AND C99 (BOTH ARE 4.7uf @ 50VDC) WITH .01uf DISC CAP-
ACITORS WITH A VOLTAGE RATING GREATER THAN 15VDC. THESE CAPACITORS ARE
ALSO FOUND IN THE HR-2510 AS WELL. THESE SEEM TO BE C139 AND C99 IN THE
HR-2510 IF MY COPY IS RIGHT. THESE CAPACITORS ARE LOCATED NEXT TO THE
AUDIO OUTPUT IC (TDA1905) IN THE RADIO. THIS I.C. IS LISTED AS IC2 IN THE
HR-2600 AND IC103 IN THE HR-2510. I ALSO FOUND THE S/RF METER TO BE VERY
SLOW IN MY RIG. I FIXED THIS BY CHANGING C302 ON THE CONTROL UNIT (LOCATED
NEXT TO J304) TO A .01uf DISC CAPACITOR ALSO. THIS CAPACITOR IS ALSO IN
THE HR-2510. AFTER THESE MODIFICATIONS, I HAD NO MORE PROBLEMS MAKING ANY
CONNECTS IN ANY MODE. 73'S AND ENJOY THE UNIDEN!
                        CRAIG/N7ETV @ WB6MQM

MONDAY DECEMBER 3, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MINI-TUTORIAL *

Keplerian data is widely used in the analysis of satellite orbits and the development of satellite tracking data for groundstations. These elements define the position and motion of a satellite in orbit around a larger body.

The first person to investigate elliptical orbits thoroughly was the mathematician and astronomer Kepler. He formulated a set of rules for elliptical orbits and was able to demonstrate that all planets followed such orbits in their motions around the sun. Over 100 years later, orbital elements defined by Kepler are still being used by astronomers and satellite trackers worldwide.

Radio amateurs use a sub-set of Keplerian data that usually includes: Reference Epoch Time, Inclination of orbit, Right Ascension At Ascending Node, Eccentricity, Argument of Perigee, Mean Anomaly, Mean Motion (sometimes replaced by Semi-Major Axis), Decay Rate, and orbit number.

REFERENCE EPOCH: (YYDDD.XXXXXXXX)

This is the precise time that the other time dependent elements are referred to. The format consists of a two-digit year number followed by a three digit day number, indicating the number of days since 01-Jan (day 0), and then the fraction of the day, which represents the hours, minutes and seconds, where one day equals 24 hours (one solar day).

Example: 03-Dec-90 12:30:15 UTC

03-Dec-90 = Year 90, day 337

12 Hours   = 24/12   = 0.500000000
30 Minutes = 30/1440 = 0.020833333 add to 0.521006944
15 Seconds = 15/86400 = 0.000173611

Therefore, 03-Dec-90 12:30:15 UTC = 90337.521006944

INCLINATION: (XXX.XXXX degrees)

This is the angle between the satellite orbital plane and the Earth's equatorial plane. A satellite with an inclination of zero degrees orbits exactly over the equator, while one with an inclination of 90 degrees orbits exactly over the poles.

RIGHT ASCENSION AT ASCENDING NODE: (XXX.XXXX degrees)

The right ascension at which the satellite crosses the Earth's equatoral plane going from south to north. Right ascension has traditionally been defined as the "first point" in the constellation Aries.

ECCENTRICITY: (0..1)

A dimensionless term used to describe the "flatness" of the elliptical orbit. A circle has an eccentricity of zero. A line has an eccentricity of 1. The orbit of OSCAR-13 has an eccentricity of about 0.7.

ARGUMENT OF PERIGEE: (XXX.XXXX degrees)

The angle between the line from the Earth's center to the satellite's point of lowest altitude (perigee) and the line from the Earth's center to the point where the orbit crosses the equatorial plane, going north.

MEAN ANOMALY: (XXX.XXXX degrees)

The angle which specifies the position of a satellite in its orbit, measured from perigee.

MEAN MOTION: (XX.XXXXXXXX perigees per day)

This is the number of perigee crossings the satellite makes in exactly one solar day (24 hours).

The semi-major axis of ellipse can also be calculated from mean motion using:

SMA (km) = 331.25 * (1440/MM)^(2/3)

Some satellite tracking programs use SMA as a replacement for mean motion. The quantity (1440/MM) yields the anomalistic period of the satellite (in minutes between perigees).

DECAY RATE: (+/- 0.XXXXXXXX perigees per day per day)

This is the first time derivative of mean motion and specifies the rate at which the mean motion is changing. A positive decay rate indicates the satellite is falling (speeding up). Decay rate gives an indication of the extent of atmospheric drag on the satellite.

ORBIT NUMBER: (XXXXX)

The number of perigees the satellite has experienced at the reference epoch.

In article <378@ka2qhd.UUCP> kd2bd@ka2qhd.UUCP (John Magliacane) writes
an otherwise excellent tutorial on Keplerian orbital elements. However,
there are a few minor errors.
>ECCENTRICITY: (0..1)
>
>A dimensionless term used to describe the "flatness" of the elliptical orbit.
>A circle has an eccentricity of zero. A line has an eccentricity of 1.
>The orbit of OSCAR-13 has an eccentricity of about 0.7.

Actually, a parabola has an eccentricity of 1. A line has an eccentricity
of infinity. Orbits with eccentricities between 1 and infinity are
hyperbolae. (The Voyager 1/2 and Pioneer 10/11 spacecraft are in hyperbolic
orbits with respect to the sun, i.e., they're on solar system escape
trajectories.)

>ARGUMENT OF PERIGEE: (XXX.XXXX degrees)
>
>The angle between the line from the Earth's center to the satellite's point
>of lowest altitude (perigee) and the line from the Earth's center to the
>point where the orbit crosses the equatorial plane, going north.

The angle should be measured the opposite way (i.e., from the ascending
node to the perigee point, not the other way around). Also, the angle
is measured in the orbit plane.

>MEAN ANOMALY: (XXX.XXXX degrees)
>
>The angle which specifies the position of a satellite in its orbit, measured
>from perigee.

No. This is "true anomaly". Mean anomaly is a somewhat artificial
value; it's actually a measure of TIME since perigee, with that time
value scaled so that 360 degrees represents one orbital period. Mean
and true anomaly coincide only at perigee (0) and apogee (180) except
in the case of a perfectly circular orbit, in which case they are
always the same.

>Some satellite tracking programs use SMA as a replacement for mean motion.
>The quantity (1440/MM) yields the anomalistic period of the satellite (in

>minutes between perigees).

Note that this is not recommended practice. Small errors in computed SMA result in bounded errors in computed distance to the satellite (which most hams don't care about, except for those doing ranging) while small errors in computed mean motion can result in unbounded errors in satellite position along the orbit as time increases. Therefore it's better to use mean moton as input to the program and have it compute SMA internally rather than the other way around.

>ORBIT NUMBER: (XXXXX)
>
>The number of perigees the satellite has experienced at the reference epoch.

This figure has probably caused more confusion in the amateur community than any other, mainly because the figures included in the NORAD/NASA bulletins are so often wrong. Some agencies count orbits as ascending nodes (south-to-north equator crossings), others count them as perigee passings, and because of continuous changes in the argument of perigee caused by orbital perturbations (chiefly the earth's equatorial bulge) these number diverge after some time in orbit.

Phil

The 100th Anniversary of Major Edwin H. Armstrong

Major Edwin Howard Armstrong, famed radio pioneer was born on Dec 18, 1890, and fell to his death on Feb 1, 1954. He is credited with being one of the

most important inventors in the field. Among his inventions are four basic discoveries that revolutionized radio, and made possible the present state of the art. These include: the regenerative circuit, which took radio out of the crystal detector stage; the superheterodyne circuit, the basic circuit of today's standard radio; the superregenerative circuit, used in military and UHF communications; and the FM communications systems which achieve static-free high fidelity reception. He attended Columbia University, and became Professor of Electrical Engineering at the school.

The members of the Major Armstrong Memorial Amateur Radio Club will be commemorating the 100th anniversary by operating Special Events stations December 15th and 16th from 1400Z to 2300Z on the following amateur bands:

10 meters--- 28.400 Mhz +/- 25 Khz on SSB.
2 meters--- 145.03 Mhz Packet Radio with the call of W2FMN which may be
             reached via the K2LSX-2 NetRom Node.
220 Mhz----- 223.42 Mhz Packet Radio with the call of K2LSX which may be
             reached via the K2LSX-3 NetRom Node.
Club Voice Repeaters located in Northern New Jersey:
             222.080 in/223.680 out W2VH/R with PL 1B (107.2).
             222.640 in/224.240 out W2QAQ/R with PL 1B (107.2).
             441.525 in/446.525 out W2VH/R with PL 1B (107.2).

Members will be using their own call signs. Special Certificates will be available for those making contacts with a member station. To receive a certificate, send a completed QSL card and a 8-1/2" x 11" SASE to:

                              MAMARC
                              100th Anniversary
                              P.O. Box 581
                              Alpine, NJ 07620

-> I am posting this for our Amateur Radio Club the 'River City ARCS'!
-> Have two(2) 'Systron Donner' Model 1626-01 MicroWave synthesizers (Sweep
-> Generators) for sale! They cover the range of 40 MHz to 27Ghz, have a
-> Digital Readout with DBM meter(Digital), and a IEEE 488 Remote Control Port.
-> They were Built in September 1982 and the warranty ended September 1983.
-> I understand that when they were new they cost around $20,000!

The above equipment has been sold!!! It sold in less than 12 hours from Posting
here on the net!!!   Thanks to all who contacted us, it was on a FCFS.
                                          (First Come First Sold)

Actually, it was a __long__ time ago. Kepler published his work on elliptical
motion in "seu Physica coelestis tradita commetariis de motibus stellae
Martis" in 1609! This contained the first two laws: orbits are ellipses,
and equal area = equal time. In 1619, he published "De Harmonice Mundi",
containing the third law, which relates distance to orbit period. In 1620,
his mother was arrested for witchcraft.

So, the basic work was done 371 years ago! This is one of the humbling things
about celestial mechanics. I'm sure I wouldn't have been able to figure this
out, yet Kepler did it 371 years ago. Obviously, he didn't have computers.
Most people don't realize that he didn't even have the benefit of a telescope.
The telescope was invented around 1609; Galileo pulblished in 1610. The
observations that Kepler used to develop his theory were made by Tycho Brahe,
many years earlier.

Peruutus: Mielipiteet ovat omiani.

Hello fellows

I have tried to scc driver instead of eagle driver whit our ARTI
board.
For some reasons, which I do not know eagle works whit our card but
SCC dos not. I have used following initialisition line:

SCC 1 init 0x300 0x16 0x0 0x4 0x1 0 3 p7158913
scc 0 ax25 lta 512 1200 256

So our arti bases 82530 chip. Glue logic can determine all most any
base address. Any way A0 is tied D/C select and A1 tied to A/B.

Whit eagle driver following command line has worked.

attach eagle 0x300 3 ax25 lta 512 256 1200

Clock frequency is changed in eagle.h file.

I am happy I someone can give answer. Anyway next week I start reading
SCC source code if there is not answer.

Technical details from arti:
DRSI,EAGLE.... look a like internal modem card.
Suport for two switchable dma lines (not tested)
A/D converter chip whit 8 lines analog mux
Realay control for 8 relays
82530-10 chip
Clock from pc OSC line or external crystal.
82530 chip addressing:selectable base address
Chanel a/b selected by A1
Data or controll regiter by A0
Addressing example:
0300 Selected base address. IBM style 10bit I/O address
0300 - 305 first SCC 82530 CHIP
0700 ADC 0804 CHIP / AD CHANEL SELECT (RD to read, wr to start
     converions an select chanel)
0b00 CARD CONTROLL (74ls377 chip) (not well defined)
0f00 RELAY CONTROLL (74ls377 chip)

>for telephone connections where the frequency control is a little better.
>Or so I'm told. But I don't know of much 2400 baud traffic here in San
>Jose.

There is some small advantage to 2400 baud but not nearly as much as you
would think. You get an average thruput multiplier of 1.25 or so due to
the fixed overhead (Txd, headers, etc) in the packet system. Real noticable
improvement requires 9600 baud.

>9600 on the other hand requires a much greater commitment and expense. The
>modulation technique in use currently involves frequency shifting a crystal,
>and you can't use it with a synthesized rig. Kantronics is selling a digital
>radio specifically for this use. It has two crystal channels, runs two
>watts, and sells for about $200. It's the DVR2-2.

Actually you can use the G3RUH modem with some synthesised radios, but you
must be willing to tinker with the PLL loop filter time constant.

>Then you need a TNC that will support a 9600 baud modem, and I think that
>means (at the moment) the Kantronics Data Engine. They're a little pricey
>for me.

Actually any TNC2 compatible unit is capable of handling 9600 baud modems.
If it has a TAPR style modem disconnect header on it, it will work. The
main problem is finding someone else to talk to at this speed right now.
Many people still think it's expensive or difficult to use 9600 baud.
It's not very expensive (~$90) and not very difficult.

Don't forget the moonbouncers, they still need the power for that path unless they use truely monsterous antenna arrays and/or lots of DSP. And when they have the monster arrays and lots of DSP the truly wacko will want to try Mars bounce. :-)

Even at HF in the late summer when atmospheric noise is at maximum, extra power is sometimes needed on 160 and 80 to make the circuit work. Power is not evil, misuse of power is evil.

A comment by someone who uses cameras professionally. In broadcast news gathering, we find that the home cameras are too small and light to be used properly. The major thing that differentiates the amateur and the professional TV photographer is the steadiness and smoothness of the professional's pictures. The very small, very light home cameras are nearly impossible to operate steadily and smoothly. Our people prefer a camera that weighs at least 15 pounds and is balanced to be carried on the shoulder. Some of the latest professional cameras are considered to be too light by many of our people and you will see extra batteries taped to their cameras to regain the mass needed for steady work. So beware the tiny cameras, the shaky results may disapoint you. The picture quality is pretty good though.

I suggest you investigate into other alternatives for your multitasking
needs like, from the most to the least expensive:

Desqview: a DOS multitasking utility lighter than MS windows
with virtual memory and a nice prioritizing of tasks based on
communication needs.

Double Dos: Allows you to run 2 concurrent DOS sessions.

Minix: an almost public domain ((c) Mc Graw Hill) version of Unix
that comes with source code for ~$100. Of course you would have
to port your application to it (it comes with a C compiler) but
it seems that you were considering Unix anyway and minix works
like Unix System 7.

>Seriously, what are you suggesting is the best route for a typical small
>hobby computer owner? My TNC cost me $120. A computer suitable for
>serious multi-processing will cost me $3,000.
>
I picked up a 68010 based, 4Mb RAM, graphics, 20Mb hard disk,
old Unix system for $900 at a hardware surplus sale. Since,
it has worked OK for my purpose. Of course, I had no support
or upgrades but then I have never needed it. It is now sitting
on a shelf doing nothing because I have no use for it anymore (got
better) I think you can do better than $3000 even if you want to stay
with PC compatible hardware. Check around at the computer fairs,
and ask the help of a friend that knows computer hardware so you don't
get ripped off. I have also seen some businesses giving hardware away
like UNIX PCs (68010/2Mb/40Mb HD).

>Mojo AA4KB

Good luck.

An Amateur Packet Radio Overview

by

Rich Bono (NM1D)

October, 1990
(revision 1.2)

The following is the result of a non-amateur asking some basic questions about amateur packet radio. Several of us thought that this information would be useful to others who are interested in amateur packet operations. Thanks to Tim Dayger for asking the right questions, and to Patty Winter (N6BIS) for her editing skills. I hope that this will be of help to many others. You may reproduce and distribute this as long as my credits remain.

Rich Bono (NM1D)

Our potential amateur packet radio operator asks:
I've used networks, on-line services, and bulletin board systems (BBS) for years, but I've never really paid much attention to amateur packet radio.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

I'm starting from scratch, and need to have some idea of where to begin.

Just what IS amateur packet radio?

Amateur packet radio is (yet another) digital transmission method available for use via amateur radio. It provides 'error free' transmission and reception of messages (information/data/etc.) between two stations. This error-free capability is a prime consideration. Error free in this context does not mean that your typing or spelling mistakes will be fixed, but that all transmitted 'data' will be received 100% intact, as sent. In fact, if the data cannot be delivered 100% intact, the transmission is eventually aborted and the user is informed that there is no longer a connection between the two stations.

The 'packet' in 'packet radio' comes from the method of transmitting your information over the air. Your data is broken up into packets (or blocks) that are transmitted. Each packet contains the sending and the receiving station call-signs and some optional routing information. A packet can contain from 0 to 256 data (or information) bytes. The users normally do not need to be concerned with this 'packetizing' of their messages. Each packet is sent and then acknowledged by the receiver when received. If a packet is not received correctly, then it is automatically re-transmitted (up to a maximum number of times). You normally don't have to know about all this to use packet radio. The 'packetizing' happens automatically, without any thought or actions required by you.

One of the more popular protocols used for amateur packet radio is known as AX.25. This is somewhat similar to the commercial X.25 standard. There is also a growing TCP/IP user base. If you are not network oriented, then the details of these protocols are not important to you as an operator of a packet radio station.

Be aware that most packet radio operation at this time is at 1200 baud. This will seem slow when compared to what it happening on networks, and on telephone BBSs.... but what is gained is world-wide access, for NO COST. Once you have your equipment, and your license, there are no fees (except for the electricity that your computer and other equipment use). There are a growing number of amateurs who are experimenting with 2400 and even 9600 (or higher) baud operation, so it shouldn't be too long before these faster rates become very popular!

What kind of equipment do I need, and how do I use it with my PC?

Since you own a PC, you already own the most expensive part of an amateur packet radio station. The other piece of equipment that you need is the TNC (terminal node controller). The TNC contains all the software and special hardware that you need. It actually contains the modem (to interface with your radio) and (usually) a microprocessor with the packet software contained in EPROM. You interface your PC (or even a simple dumb ASCII terminal) with the TNC via serial RS-232. Use your favorite terminal emulation software on your PC (the same software that you use with your telephone modem will probably work fine). This is just as easy as connecting your computer to a modem. If you don't want to use the serial port of your

computer, there are TNCs available that will plug directly into the bus.

If you don't have a PC (personal computer), then almost any RS-232 ASCII terminal will work with most of todays TNCs.

The most popular packet frequencies in the USA are in the two-meter band (144-148 MHz). Check out the following frequencies (they may be different in your area; ask a local amateur if you don't hear anything). Even the typical 'police scanner' can be used to listen to these frequencies:

145.01, 145.03, 145.05, 145.07, 145.09 MHz

If the above are busy, many areas also use:
144.91, 144.93, 144.95, 144.97, 144.99 MHz

Yes, this is with an average FM transceiver set for SIMPLEX operation (transmitting and receiving on the same frequency).

If there are packet radio transmissions you should hear a sound like:

BBBBbbbbbrrrrraaaaaaapppppp

How much technical or hardware proficiency is required to use a packet radio system?

If you can plug an RS-232 cable into a modem, and wire the TNC to your radio, then you have all the ability that you need. I am sure that there are hams in your area who would be glad to help you if you are not comfortable with wiring a microphone connector. Most TNCs connect to the microphone plug of an FM transceiver, normally only needing push-to-talk and transmit audio connections, and a connection to the speaker audio output from the FM receiver. This consists of about five wires, and can usually be done without removing the covers of the radio (these are normally external connections).

Installation really is very simple, and once it is done, there is virtually no maintenance. Just plug in your TNC in place of your microphone and external speaker, and you're on the air... to return to voice operation, plug in your microphone. If you like, build a simple switch box to allow easy changing between your TNC and voice operation. I don't recommend it, but some people wire the TNC and microphone in parallel, so that they don't need to change the plugs, or switch anything at all.

What's out there for me to access via packet radio and what potential is there for growth?

This is the interesting part! I believe that packet radio is still in its infancy. It seems like every day a new application for packet radio is announced... some are good ideas... others not. By the time you read this, a lot of the information presented here will probably be out of date; yes this technology is progressing!!!

Here is a *simple* list that barely highlights some of the available uses of amateur packet radio.. I am SURE that I have forgotten something and left it off the list:

EMAIL:

At this time we have world-wide email (electronic mail) distribution. I personally have received email from a few continents, and from all over the USA. Of course, this is limited by the amateur radio rules and regulations, so there cannot be any commercial messages.

Local networks:

Here in New England we have connectivity over most of the region. I can connect to other stations from the following areas consistently: Canada (Montreal), Vermont, New Hampshire, Maine, Connecticut, Massachusetts, Rhode Island and New York. I should note that I am located about 10 miles north of the MA/NH border (in Derry, NH).

Of course, on the HF (high frequency) bands there can be world-wide connectivity, depending on many factors.

PacketCluster-DX spotting:

This is a specialized system that allows a couple of hundred users to be connected to the same system at one time. It is used by those amateur operators who seek contacts with rare stations throughout the world. When any one user 'finds' a rare station on the air, he simply types the information (call-sign, frequency and mode) into his terminal, and within a minute or so, all of the other users are informed of the rare station!!! So-called "DXers" (people who like to hunt these rare stations) LOVE this system. These users can be spread over a wide area. Our local packet cluster system has connectees from Maine to New York.

DOSGATE:

A system that allows you to execute programs remotely. A DOSGATE system may have many programs for you to use over the air. You don't need to download the programs to use them; you are actually running programs remotely. DOSGATE allows those who don't have a computer to run programs via packet radio.

For example, my DOSGATE system has the following programs available for use by remote packet users:

AUTOEXAM: Take sample amateur exams from Novice to Extra. You can use AUTOEXAM as a study guide, or to see if you are ready for a certain license exam.

SeeSats: Real time satellite tracking. Informs you of where the current OSCAR (and other) satellites are located.

AUTOCALL: On-line amateur radio USA call-sign lookup database. Simply enter the call-sign of any amateur radio operator in the USA and it will print out the name, address, license class and previous call-sign (if any).

GAMES: Several adventure-style games that can be played on-line.

Repeater database: A database of many of the repeaters in the area.

Gateways:

Even though you may not own any HF or UHF equipment (many packet radio operators only use a simple hand-held VHF transceiver), you can gain access to other bands and operating modes by using a gateway. A gateway allows connectivity between two normally non-connectable communication technologies.

In many areas not only are there major BBSs on the standard two-meter Technician class frequencies and the 222 MHz Novice class sub-band, but there are cross-band gateways available as well. A Novice on the 222 MHz band can connect to a station on the 145 MHz band by going through a gateway and be able to communicate with many other amateurs.

Public Service:

Many packet stations are used to help out with sending messages during disasters. Amateur radio operators help out whenever they can, and many hams have their packet stations ready for portable operation to help when needed. There are many training exercises during each year to help practice and test the readiness of the emergency stations.

OSCAR Satellites:

OSCAR stands for Orbital Satellites Carrying Amateur Radio. We have our OWN satellites in orbit that are dedicated for amateur radio use. There are some satellites that are dedicated to packet radio (sometimes called "PACSATS"). These are for 'store-and-forward' operations to help distribute packet traffic around the world.

Bulletin boards:

These carry postings similar to the stuff on Usenet (or telephone BBSs) and often have archives of useful files (such as local ham license testing sites). These are usually the same packet nodes that transport email.

File transfers:

Better at 56 Kbaud (as some hams are doing), but feasible at 1200 baud. On TCP/IP, you just start it and forget it, so you can do it overnight or at some other time when you don't care whether it takes a while.

Databases:

In some areas there are HAZMAT (hazardous materials), call-sign, and repeater databases accessible via the network.

Station-Station:
I almost forgot.. many people simply enjoy chatting with their neighbors.... This could be with people across the street... or in the next state... or half-way around the world!

I am sure that I have missed something. You asked about potential... as I mentioned at the beginning, we are just getting started!!! Many people are just finding out about packet radio. I believe that the only limitation is our imagination!! We could have a world-wide network (we do currently have a 'slow-speed' world-wide network) in the near future... It just takes a little imagination...

How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?

Well, if you own the PC already... TNCs can be purchased from about $120.00 on up. There are a few for less money, and several that provide for operating on many digital modes in addition to packet radio (i.e., the Kantronix KAM will provide for packet (HF:300 baud/VHF:1200 baud), AMTOR, RTTY, ASCII, NAVTEX, WEFAX, CW (Morse code),...).

If you already own an amateur FM transceiver (or an HF SSB transceiver) then you have all the equipment needed. If not, a two-meter FM transceiver can be purchased for used from $100-250.00, new from $300.00 on up.

Cost effective.... Hmmm, well first be aware that amateur radio cannot be used for any commercial or business purposes... But where else can one get hours (years) of enjoyment and service out of $470.00 ($350 for a radio and $120 for a TNC, assuming you already have the computer or terminal). Note: This stuff can be contagious.... be forewarned!!

What legal issues do I need to consider regarding packet radio? Do I need a license?

Yes, you need a valid amateur radio license. There is (in the southern New Hampshire area) packet radio activity on the Novice bands. But if you want access to the mainstream of packet radio, you will want at least a Technician amateur radio license. (Although, as mentioned earlier, some areas have an active packet radio network that is accessible with the Novice amateur radio license.)

I've tried reading about amateur packet radio, but a lot of it is Greek to me. Please suggest some reading materials such as books and magazines that my campus or local libraries might carry.

There are a few books, etc... but I have found that most assume that you already know about amateur radio. You need to find what we call (ready for another term?) an "Elmer". An "Elmer" is a friendly, helping amateur radio

operator who will take you under his/her wing to help and guide you as much as you need. I hope that you can find someone to help you... it takes a special kind of person to be an 'Elmer' (gosh I hate that term).

Good luck with your packet radio activities. If you find this information helpful, I would be glad to hear from you.... How? Simply send me a message via the amateur packet network, NM1D@WB1DSW.NH.USA.NA from anywhere in the world!

A low end Amiga runs about $500 with multitasking. You don't need
a 68030 workstation, you just need enough speed to keep up with what
the Z80 in the TNC would do, and enough left over to run your terminal
program. The original poster has a mac se/30, which certainly ought
to be fast enough too. I think either of those has enough hardware
buffering that you don't have to interupt for every byte that comes in.

If you have the multitasking OS, I just don't see how taking out that
Z80 is going to chew up a huge amount of resources from the computer.
If you want to run 56kbaud, then you would certainly be justified in
offloading all that processing to an external TNC, but then a normal
TNC 2 wouldn't keep up either.

The TNC would be more convenient, since it is just plug'n'play, while
someone (maybe the user, augh!) would have to write the pad program
for the computer. Maybe you can't do it on a base level PC.. and buying
a TNC is going to be cheaper than upgrading.. but LOTS of people already
have capable computers. If you feel crippled without multitasking, you're
right!

Well, I'm not convinced that it has no relevance to amateur TV and/or Novice training tapes, but in any event my question has been answered, and I'm grateful to all who offered suggestions.

SUBJECT: Packet-Radio Digest V90 #194

Subject: Which TNC?

The world seems to be going through cycles on this one.. First home-computers had separate disks, cassettes, CPUs, video modulators, power-units, modems etc; then the 'system box' came along (IBM-PC style with everything in the one case) but then that was outgrown.....
I use a DRSI card in an old original 4.77MHZ PC (twin floppies......!) and IMHO its biggest advantages are aesthetic; i.e. no extra box, power supply, connecting cables etc. When the packet station has 24-hour-a-day visibility (next to the TV!) a minimal-cables solution helps domestic harmony; internal dialup modems help here too...
Now as to the processing power, something like the DRSI card is rather lacking.... the 8530 is not the World's best HDLC-generator, and theres no buffering to speak of on the DRSI board, so you get a LOT of interrupts; this can cause problems. Faster hardware will evolve; and with the current low price of second-user IBM-PCs etc, why not have a dedicated box?
IMHO multi-tasking on the majority of small industry-standard computers

stinks.

Well, make that 200 watts for HF and non-moonbounce. But if you're going to
make an exception for EME, why stop at ONE KW? Why not 20? One wonders what
ingenious work with antennas, DSP, etc., would have been tried and perfected if
the KW was not available. Mars? Hmmm, lessee what's the pathloss for that...

Agreed - we've played with this out here. I think that the "default" TX
delay in a new tnc is still around 300 milliseconds, isn't it? If, at
1200 baud, you're dealing with a short packet length (say, less than 50
bytes, including headers) of less than 400 milliseconds, then more than 40%
of the transmit time is "dead carrier". Solid state TR circuits and
quick-locking modern receivers just don't need that.

Maybe we can ask the TNC manufacturers to make less obnoxious and less
aggressive level 2 controllers -- chances are, the end user won't play
with these stats.

>program. The original poster has a mac se/30, which certainly ought

Sure, single port and a terminal program is no problem even on a Xerox
820 or a C64. If that's all you want, a glass tty simulator on a slow
channel, then go for it. But the computer will still be tied up doing
channel access and character at a time processing. Not a lot of multi-
tasking power will be leftover. Certainly very little will be left to
do other time critical processing.

>to be fast enough too. I think either of those has enough hardware
>buffering that you don't have to interupt for every byte that comes in.

Unfortunately they don't. The SIO is double buffered as is the 8530 so
at best you need one interrupt per 2 characters at the start and once
the buffer pipeline is full, you have to pull them out as fast as they
come in or you have an overrun condition. This is no problem for a single
channel even at higher baud rates. Where the system falls down is with
multiple channels or when the processor has other time critical tasks
to perform such as managing the display or disk.

>If you have the multitasking OS, I just don't see how taking out that
>Z80 is going to chew up a huge amount of resources from the computer.

On a 33Mhz 386 running Interactive Unix, serial baudrates in excess of
9600 baud fail. Adding a 16550 with it's 16 byte fifo extends that to
just 19.2kb. If you have more than 8 processes going at once, almost
guaranteed with Unix, each process will have less compute power

available to it than a 4 Mhz Z80. And a 4 Mhz Z80 can't handle a single 56kb channel, though a 6 Mhz Z80 can. The problem is servicing time critical data streams. Unix is not a realtime OS and is easily overwhelmed by multiple fast external data streams that it can't flow control.

>If you want to run 56kbaud, then you would certainly be justified in
>offloading all that processing to an external TNC, but then a normal
>TNC 2 wouldn't keep up either.

Well a TNC2 can keep up with 56k if you soup it up with 6 Mhz parts and use a special version of KISS that is optimized to the channel. The Z80's forte is interrupt servicing. But KISS processing is not enough offloading to solve the problem. You gain nearly 32k of buffering in the TNC and you offload channel access control but the host still has to deal with character at a time serial IO to get the packet inside where it can be validated or discarded. On a busy switched trunk, you can still have a buffer overflow.

The better solution is a smartcard in the host that can validate the packet and issue a single interrupt to signal the host that a valid packet addressed to the host is available. Then the host can easily handle multiple channels and do the routing or applications processing required.

To give a real world example, one of our switches on an AT clone can deal with four 1200 baud channels. But add a fifth channel and characters are lost. With a 56kb channel, buffered by a special Kiss TNC and using a 16550 on a 19.2kb serial link to the PC, characters are lost if more than one of the 1200 baud channels are active at the same time. The normal packet retry mechanisms make it work, but the efficiency is very low.

I firmly believe that multitasking is not the correct answer for packet switches or application servers. Instead, coprocessing is the best way to go. The Grace card is already on the market and other, cheaper, cards soon will be available.

None of my comments should be construed to mean that, for single users with light demands, simpler, less hardware intensive means aren't suitable. They are. However, the way packet is evolving, it makes sense to look at the requirements for more serious uses of packet channels than keyboard chatting.

Do you have access to both Usenet and your local VHF packet BBS?

Can you help me with a little experiment?

I need several packet stations who can do a couple of tests for me, which involve listing some bulletins off of their local VHF packet BBS, and then e-mailing the listings to me on Usenet. This is just a short term experiment, and quite easy.

I need folks in several areas across the MIDDLE of the USA, like in Salt Lake City, Denver, Kansas City, St. Louis, and possibly Chicago, Atlanta, Nashville and New Orleans.

I DO NOT need anyone on the West Coast, in Texas, Minnesota, Ohio, Florida or New York/New Jersey.

If you think you can help, contact me and let me tell you what I need.

Thanks!

Mojo,

Most of your posting has already been addressed by others. (Let me suggest that you pay particular attention to Phil Karn's comments.) Three specifics, though, deserve additional treatment:

<<I've seen you all arguing for doing the packet processing on the main CPU. The only example I have for doing this is NET and NOS, and it's *not fun*!>>

While you're entitled to your opinion, so am I: I find straight-AX.25 packet intolerably boring. On TCP/IP, I have a *blast*. Waiting for a crowded AX.25 channel as a message slowly appears in bursts on a terminal emulator screen is a waste of my time. So is waiting 10, 20, 30 minutes for NET/ROM to establish a link to a node I could almost *drive* to more quickly. Naw, I'd rather interact with a local computer at my own pace (fast) and let the system do the dirty work while I go off and do something else.

<<What's more, if I don't leave my computer on running NET or NOS at all times, there is hardly any chance that I will ever receive any mail.>>

Not true. Leave it on overnight. And while you're at work. That's more than enough. I'm one of the more-active Eastern Mass stations and I'm only up 40-60% of the time. I use a Mac, so multitasking is easier for me, but I frequently shut down NET to give the full CPU to some other application. No big deal!

However, you won't receive any mail unless people want to send it to you. You must send it to receive it, so to speak.

<<After using TCP/IP for a while, I realized that there just wasn't anything to *do* with it and I've all but given up.>>

This comment has been heard before, and there's some validity to it. Here in New England, we just published the first installment of a listing of the things people can *do* on our network... the various kinds of servers, gateways, etc. that are on the air. You're right, unless there are *applications* to be used, people get bored unless they're into it for the simple challenge of getting the system to work. But in all fairness, this is not an area where you can expect the networking software gurus to provide everything. This is an area for local organizing, writing articles for newsletters, elmering, cheerleading, and plain-and-simple application programming to interface to the standard comm package.

There are already some interesting things available to "hang off" a packet IP network... quick sample of some of the New England amprnet services: W0RLI

gateway, Internet gateway, callsign server, conference bridge (="crowd" node),
mailbox systems, local news in FINGER form, and of course lots of file servers.
At least two people I know about are in some stage of making tcp-to-dialup-bbs
gateways.

Can more be added? Absolutely! As people get interested and
excited enough to do the work. But I don't expect Phil, Dewayne, Bdale, Kelvin,
et al to do that work for us. I'm just grateful for all they've done
so far!

TCP/IP boring? No way. I'll pick a "real" network anyday. I don't enjoy
beating my head against a wall (or watching my TNC implement a protocol that
effectively does the same thing).

I wish I could get more people in my local area (central Texas)
interested in using NOS - it's a heck of a package and beats the heck
out of BBS reading and "talking" to other users through the keyboard!
If anyone has ideas on how to stimulate interest let me know. Also, in
reply to those who want to use their PC for other things while NOS is
operating, how about Windows 3.0? NOS works fine in background while I
fool around with other things. I ran it on my 386SX with 2MB with no
problem, now with 4BM, it's even better!

<< Posted for and on behalf of VK5ZSV>>

  Hi there, has anybody got information on how to modify an FT-726R to be
able to use it on 9600 baud.

  I am mainly interested in a way, to directly FM modulate this device,
bypassing the inbuilt audio section.   I intend to use the G3RUH modem with
the FT-726, I believe that '3RUH modem has been developed using this
Transceiver, so there must be some information about somewhere.

No worries about the RX part, I can get to the Discriminator easy enough,
I'm not up to scratch on solid state FM modulation though.

My main worry is, I cannot afford to ruin this tranceiver, not able to
replace it.

If anybody has got information on this, please let me know, I sure would
appreciate it.

Please mail replies to xtasc@lv.sait.edu.au
                       VK5ZSV@VK5WI.#SA.AUS.OC on packet radio.

This must have popped up somewhere.. but can anyone give a quick
overview of the NOS bbs setup - directories, files and their formats?

I suppose this is not (yet) in any of the NOS docs?

I sincerely hope that the internationally-recognized propagation beacons have all been withdrawn from their traditional place on 14100.00 kHz. I hope so, because it appears that any beacon trying to "do its thing" on that channel will be absolutely inundated by the horrendous packet racket currently taking place on or within a few cycles of that supposedly protected channel.

You don't have to be an expert to understand this problem. Propagation beacons operating with low powers down to a few watts simply cannot survive amidst this monstrous gang of packet bandits that infests the 14100.00 kHz region.

Is it possible that these packet freaks simply do not KNOW about the beacons? Is it possible that they cannot pick a channel at least one kilohertz AWAY from the 14100.00 kHz spot? Is it possible that they don't understand how to read and interpret their radio's tuning display?

It's easy to hear and see who is operating on or near the beacon channel. Just set your packet TNC to whatever it needs to copy 300 BPS packets on HF. Next, set your radio to "CW", then "LSB", then "USB", then "FSK". Now rock your tuning dial a wee bit -- one hundred cycles will do -- and watch the collection of eggheads, turkeys and idiots running BBSs, mailboxes and KA Nodes and the like! And I'll wager - no, I'll guarantee it! -- a number of these American packet systems run unattended, an obvious violation of Part 97.

=========
SpaceNews
=========

MONDAY NOVEMBER 19, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MARS VISIBILITY *

The planet Mars will be visible to those living on the east coast of the United States. The planet will appear as a reddish "star" in the eastern sky. Best viewing will begin around 8:00PM local time. Mars will be closest to Earth on Tuesday, when it will be about 48 million miles from Earth. Viewing should be equally good through early December.

* SALYUT-7 NEWS *

The presently unused and long abandoned Soviet space station 'Salyut-7' is tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere in mid-January. Attempts to boost the 60 metric ton structure to a higher orbit have failed. Salyut-7 should produce quite a spectacular light show if it re-enters the atmosphere away from sunlight.

Here is element set 633 for Salyut-7 as released by NASA on 14-Nov-90:

```
Epoch    : 90 318.01787657
Incli    : 51.5983
RAAN     : 257.2085
Eccn     : 3.837E-04
ArgPer   : 109.0767
MeanAn   : 251.0680
MeanMo   : 15.82804120
Decay    : 1.11688E-03
Orbit #  : 48841
```

* PACSAT NEWS *

==========
Work continues on UO-14 and AO-16. DOVE-1 will be reset shortly after
software testing on the other Microsats is complete.

* RS-14/RUDAK-2 NEWS *
======================
Reliable sources within the Soviet Union indicate that the launch of RS-14/
RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR
requests the help of radio amateurs all over the world to collect telemetry
and send it via packet radio or via a SSB net to him. The first day's worth
of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on
145.948 MHz SSB and will be vitally important to ground controllers. Later,
after ALL systems are working properly on the RUDAK-2 transponder,
PSK/BBS/MODE B operations will begin.

* TNX QSL! *

How about buying it. You have to purchase it from Prentice-Hall it will cost
you about $150.00!

Me, too, but what good is it if everyone does multiple posts? With RARE
exceptions the only time I post an article in two or more newsgroups is in
reply to someone else who did (and I'm therefore uncertain which one he's
actually reading). But some people do it habitually. That would tend to defeat
the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only
FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more
descriptive.

Right. Guys in Chicago in the Good Old Days would kill to get Gould to slip
their ham callsigns into the Dick Tracy comic strip, which he did regularly.

Some other drawbacks are shorter recording time for the 8mm camcorders due
to the smaller tapes.
Also, if you want to play 8mm tapes back through your VCR using VHS tapes,
you must record the 8mm onto VHS tapes. This naturally reduces the quality
of the final playback due to the addition of noise.
I think the rule of thumb is that every cope of a copy will have twice the
noise in it so that a copy of the orginal will have twice the noise of the
orginal making it look much grainer or fuzzy.

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper messages. As long as we make a good faith effort to comply, the FCC won't nitpick if an occasional clinker slips through.

8mm tape are typically 120mins long with no necessity to reduce speed.
To get the same portability, the VHS-C is comprimised in terms to record time.
They typically get 20min in standard play and 1hr in slowest speed, and
naturally the worst video image. Even in its fastest speed given camcorders
in the same price/feature catagory, 8mm is still better than VHS-normal, abeit
only slightly so...

I will reply directly to Norm (I know him well) but this is for public
consumption.

The existing `channels' for packet, 14.103, 105, 109, 111, and those
below 14.098 are standard. It is unfortunate that packet users drop
right down on top of these beacons, which do serve a useful and interesting
purpose. I really do believe however, there is total ignorance of
the very existence of the beacons by most of the offenders. The beacons
are (necessarily) low power. The beacons are not well publicized in
my opinion.   Early in the recent history of these beacons, very ill
informed people defending the beacons made a very poor case (read that
K3NA before the ARRL digital committee) stating the spectral needs
of these beacons. The facts are that this is an extremely low bit rate

signal (if you want to think of it that way) and extremely tight filtering could achieve a big increase in carrier to interference ratio. The case being made for a guard band that was larger than the occupied spectrum of one packet radio signal went over like a lead balloon. In my opinion, the defenders in this case lost what little protection could have been afforded by the ARRL. This of course would have been limited to publishing operating guidelines and this would be available primarily to US hams only. The primary source of packet clutter on 20 meters is the HUGE increase in the numbers of people from South and Central America who have discovered packet in a big way and are really loading up 20 meters AS IS THEIR RIGHT TO DO. I am sorry to see the beacons get inundated but the tirade will serve little purpose. It is a 'done deal'.

Bob

While waiting for my license to appear in the USnail, I thought I'd put the wiring together for my HK-232 and FT-470.

When I bought the Yaesu, the salesman also sold me a sub-minature stereo plug for the PTT/AUDIO jack. I assumed that PTT and AUDIO were two seperate lines and was prepared to wire it as such.

Now after reading about 3 different articles on wiring hand-helds, they all seem to indicate that PTT/AUDIO are on the tip.

Anyone want to give me some first-hand information? I really don't
want to re-wire or possibly damage either the TNC or the Yaesu.

Thanks in advance.

Hi! I'd like to tap into the net.wisdom here. I just acquired a TNC, and I'd like to run HF packet with my venerable TS830. But I now see that the optimum bandwidth is something like 500Hz. Now, the TS830 has only one SSB position, with a 2.4 kHz filter. I _do_ have 500Hz CW filters in both IFs (16 poles of 500Hz!), but they are selectable only in the "CW Narrow" position. Does anyone know of a modification to get the narrow filters in SSB mode on these radios? Alternately, I suppose I could run true FSK, with a capacitor diode-switched at some strategic spot. This would be relatively straightforward to do in the CW mode. Of course, then I would have to do some kind of modification to the TNC (MFJ1278) to get the digital data out for the FSK.... Has anybody out there already invented this wheel? Hopefully, I'll find out that the filter is chosen with a dc level....

Hi there,
I'm a kind of new in this business. So I'm not quite sure if anything I write
is understandable. But I'll try my best.
I currently, as I understand it I'm working on a net called internet. As I
know, there are several gateways to other nets. So I think there may be a
gateway to packet radio as well. The idea is to send e-mail to some friend
of mine, who doe's packet radio.
Can anyone tell me, how that will work?
Thanks in advance,

Oliver 'Broke' Breidenbach

<obligatory statement about how i'm sure this
question has been asked a zillion times before>

Are there any good books or other sources of information on packet radio? The tcp/ip stuff discussed here sounds particularly interesting; I have a XENIX box that would love to be involved :-) Anyone know if there's packet traffic in the Monterey Bay area?

Regarding serial io overhead... I have an old (well, 3 years old) smart multiport board. It has an 8088 onboard for smarts, and 128k of dual-port memory for a buffer and communication with the host cpu. Since it's dual-ported, io is as fast as memory access. It can be set during initialization to only interrupt when a certain amount of data has accumulated, etc. This is pretty old stuff, and cheap nowadays. It seems to me that this sort of hardware + a modem will always be cheaper than a dedicated TNC that includes onboard cpu and (preferably memory-mapped) buffer, since there is a *much* larger market for it... yes, the protocol will then have to be handled by the host, but I think even my lowly SX would be able to handle it with plenty of CPU time to spare for the other things it's used for, esp. with the nice buffers. It can't be much worse than SLIP.

Greetings,
Could some one point me in the right direction as to the ideal transceiver
for high speed (well 9600 baud) packet operations, what of the direct
connect digital radios that were once touted on this net.
  Is there such a thing as the ideal transceiver for packet operations?
Roger Smith

Jim, unless you can get your program licensed by the FCC as a control
operator, it does NOT comply with the rules requiring a control operator
to screen traffic before it goes on-air.

In article <5796@crash.cts.com> skipsand@crash.cts.com (Skip Sanders) writes:
>Jim, unless you can get your program licensed by the FCC as a control
>operator, it does NOT comply with the rules requiring a control operator
>to screen traffic before it goes on-air.

Technical Opinion:
I believe Jim transmits from Canada, and thus the FCC has *no* say in the
matter. Furthermore, Jim is no doubt aware of the relevant Canadian DOC
(Department of Communications) regulations.

Logical Opinion:
But I think you are being a bit picky about the regulations. Being too picky
could unduly restrict some pretty major innovations, and I think Jim provides
a useful service.

Show me where in the regs it says a control operator may not employ mechanical aids to facilitate the screening process by marking for human review all messages containing certain key words and phrases he has selected for use in a grep process.

Let's not try to be more British than the British here. As I said, the FCC expects a good faith effort, but they're not dumb enough to expect 100% accuracy EVEN WITH 100% EYEBALL INSPECTION. No matter how it is done, a tiny percent will slip through when somebody yawns or blinks.

I am not replying to your comment everywhere you posted it. People jump on ME for answering articles in all the newsgroups the originals appeared in. Go figure!

DIGITAL-TELEMETRY OF "RADIO-M1"

17-Nov-90

by AMSAT-U (RC2CA/UA3CR)
and AMSAT-DL (DG2CV/DB2OS)

Digital telemetry consists of 30 parameters + 2 constants.

To receive the digital telemetry it is necessary to use an FM-receiver, modem, de-scrambler and a personal computer.

Table 1: Digital Telemetry Equations

Line	Parameter	Formula	Unit
1	Transponder #1 HF ouptut pwr	0.2N^2	Watt

=========
SpaceNews
=========

MONDAY NOVEMBER 26, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* RS-14/RUDAK-2 LAUNCH *

AMSAT-DL officials have been informed that the launch of RS-14/RUDAK-2 will occur on or about November 29, 1990, plus or minus one day. Also, it is not expected that the RUDAK-2 transponder will be turned on until three days after launch. Radio amateurs should not expect to hear the CW beacon from RUDAK-2 until December 1, 1990. Efforts are still under way to provide a launch net on 20M starting about an hour before launch. UA3CR requests the help of radio amateurs worldwide to help collect telemetry and send it to him via packet radio to him once the CW beacon is turned on. The CW telemetry beacon can be heard on a downlink frequency of 145.822 or 145.948 MHz SSB.

The CW Morse-Code telemetry frame will consist of the registration call RS14 and 8 four-digit lines in the following format:

```
     RS14  1A 1B 1C 1D
           2A 2B 2C 2D
           3A 3B 3C 3D
           4A 4B 4C 4D
           5A 5B 5C 5D
           6A 6B 6C 6D
           7A 7B 7C 7D
           8A 8B 8C 8D
```

The 1A to 7A lines are analog telemetry data. Line 8A is a calibration engineering parameter.

The first digits from 1A to 8A are system status data. Figure 6 means general operating status and figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are line (channel) numbers.

The third and fourth digits from 1C to 8D are analog telemetry values.

RS14 Telemetry Decoding Parameters:

Line #	Parameter	Formula	Unit
0	Transponder power output	0.05N	Watts
1	Transponder PA Temperature	N	Deg. C
2	+24 V Regulated Bus	N	Volts
3	+16 V Regulated Bus	N	Volts
4	+ 9 V Regulated Bus	N	Volts
5	+24 V Regulated Bus	N	Volts
6	Inside Temperature	N	Deg. C
7	Service	N	*

* STS-38 NEWS *
==========
Several independent observers in central Florida and Texas observed Atlantis and the USA 38 spy satellite payload deployment during mission STS-38 last week. Observations seem to indicate that a problem might have occurred with the satellite and it might have been brought back to Earth by the shuttle.

I hope not. Prentice-Hall holds the copyrights and sells it for about $150.
What goes around on the net are upgrade patches and programs for minix that
others write and decided to put in the public domain. They assumes you have
already purchased a copy from PH, though.

For more info on minix, I'd recommend comp.os.minix.

What you are experiencing is a classic case of tone twist. This was hashed
out by the experts several years ago. FM communications radios don't uniformly

adhere to the 75 microsecond preemphasis/deemphasis standard. Thus the ratio of the levels of high frequency and low frequency tones isn't maintained from the microphone jack of one radio to the speaker jack of another unless the radios are of the same make and model. The expert's solution was to bypass the preemphasis circuits by feeding the tones direct to the modulator and extracting the tones directly from the discriminator. This worked wonderfully well. Unfortunately, the expert's advice was uniformly ignored by the average ham who didn't want to "modify" his radio by running two wires inside the case. Some TNC manufacturers tried to solve the problem by building equalizers into the TNC. Unfortunately again, the manufacturers didn't agree on how much or in what direction the equalization was to be applied. So you can wind up with as much as 20 db of twist between two TNC/radio combinations that happen to go in opposite directions.

What to do about it. Volunteer to give a program about tone EQ at your next LAN meeting. Urge everyone to adjust their equipment so that the high tone has 3 db more deviation than the low tone on a good deviation meter with NO EQ. For the "I don't want to open my radio because it'll void the warranty" types, a simple external RC network will work. EVERYBODY will benefit from a good Level 1 signal.

Also true.

>Let me fill in a few details and ask some questions.
>
>I have a 80386 Box running ISC 386ix.

Me too.

>1) Can I use packet radio to retrieve netnews data ?

Yes, but there are details. :-) There are both legal and technical issues
to consider. First the technical issues. ISC's TCP/IP has neither a slip
driver nor an AX25 driver that can be used for packet radio. A partial
solution is a version of KA9Q's Net code for Unix that does understand
packet radio, unfortunately, it is really a DOS program that has been
transplanted to Unix and won't integrate with your News software easily.
A better solution is a dedicated DOS box that runs the DOS version of
KA9Q and talks both to the radio and an ethernet board that in turn talks
to the regular ISC TCP/IP on your Unix box. This absolutely, positively
works.

Now the legal issues. If you are an amateur radio operator, handling messages
originated by other people is called "third party traffic" and must be
screened by a "control operator" before being transmitted. Certain things
are prohibited such as profanity and commercial use. This screening is
practically impossible for a full netnews feed, but can be done for a limited
number of groups. If you are not a ham, or the amateur rules are too
restrictive for you, then you may apply for a commercial license for a
point to point system from the FCC. There are certain fees involved in
this as well as issues of frequency coordination and proof of need. It
can be done, but is not necessarily easy or cheap.

>2) What equiptment would be needed to have a quality setup to start in this
>   area without spending a LOT of money.
>3) What are the costs (equiptment, govt. fee's etc.)

For an AMATEUR packet setup, assuming you buy everything new, you'll spend
between $600 and $900 per station. Equipment is available that will work
at 1200 baud, 2400 baud, 9600 baud, and 56000 baud. Somewhat surprisingly,
the 56 kilobaud equipment is not the most expensive system.

For a COMMERCIAL packet setup the costs run two to four times as much for
the same performance levels and 56 kb is not available at all.

>this to me?

My understanding of the matter is that there are two techniques used to
achieve higher than 2400 baud data rates over phone lines. One uses data
compression (MNP 5, V42bis), the other uses multicarrier modulation (telebit).
Data compression can certainly be used with the 56kb modem, though the
effectiveness of compression depends on the content of the data. Text
compresses nicely, but binary data compression is not so impressive.
Multicarrier technology is totally different from the minimum shift
keying used by the 56 kb modem. It uses DSP bandwidth shaping and
training sequences to achieve high thruput. Used with conventional
packet protocols, this would not be effective since a new training
sequence would likely be required at the start of each transmission.
I don't know of any amateur work being done using multicarrier
techniques.

If a packet transmitter were allowed to concatenate many packets it has
queued up together into a single transmission sequence (with some reasonable
limit, of course) then you would only need one training sequence for many
such packets. This would require all the receiving stations to listen
from the beginning to a transmission that may contain few to none of their
packets. Of course a means to separate the packets has to be part of that,
but that is probably the easy part.

This would work best in high volume paths. Short of some large file
transfers, typical packet users would not benefit much from this. It
should be workable on point-to-point links just fine, I'd think.

I am thinking of this being more useful in major backbone trunks. When
there is only one packet to send, go ahead and sent it solo, with its
own training sequence. If that added time causes more packets to be
queued up than can be sent one at a time, then start sending more in a
single transmission as they are now queued up and ready to go. If the
node becomes overloaded you would benefit from the speed improvement
with not too much loss from the training sequence.

Regarding the orginal question...

According to Shannon's channel capacity formula, the capacity of a given noisy, band-limited channel is a function of both the bandwidth and the signal-to-noise ratio. Telephone modems can achieve very high b/s-Hz ratios because the S/N ratios are relatively high. The lower S/N ratios typical of radio paths requires more bandwidth to achieve the same data rates.

This also explains why telephone modems are not likely to give good results over amateur packet radio. They are designed for a different set of conditions.

I agree...I have found that the most rabid chest puffers and flag wavers
have never had much experience living in another country and experiencing
their perspective...sometimes is best to keep one's mouth shut about things
one hasn't experienced personally.

My experience living abroad taught me to really appreciate the good things
about my country and not blindly accept those things that ought to be
changed.

Step down from soapbox and get back to packet racket.

Are the sources to the TAPR TNC code easily available? We have an implementation here which is fine in all respects, except that there's no way to get out of KISS once you've invoked it (short of jumping on the TNC and buying a new one, that is!). I feel that, given the source code, it would be a simple matter to fix this one. Anybody know the situation regarding this stuff? And does anyone know how we can contact TAPR?

> The lower S/N ratios typical of radio paths requires more bandwidth to
> achieve the same data rates.

Hmmm, currently, I know of people operating locally with both 1200 and 9600 baud links. Although, in this area, 1200 baud is the dominant force still and there is a big resistance in moving to 9600. At 9600 baud, what amount of bandwidth is being used? as compared to 1200 baud? Also, the Ottawa group is working with a 56KBaud link and have a 9600 baud satellite link to us, although the datarate in use is 1200 yet again.

> This also explains why telephone modems are not likely to give good results
> over amateur packet radio. They are designed for a different set of

Granted ... there is more noise on a radio link than a land-line. I guess the position that I was trying to put forward was the effective utilization of bandwidth (at least to some degree). Well, it'll make sense to me soon.
I'm taking the new radio course for the new regulations.

Dan

A couple of questions about the nifty-looking packet board from the Ottawa group:

1) Can one pc support more than one of these boards? IE, can we run two 56KBPS (or whatever) links on a single machine?

2) Is the low-speed port an asynchronous one, or can it also be used to directly drive a modem? And if so, at what maximum speed?

3) If the low-speed port is a standard serial port, can it be addressed as COM3 or COM4?

4) Is anyone working for a driver to use this board with the G8BPQ netrom code? NOS is fine with me, but we have a switch site where we'll be using BPQ at least for a while.

5) Finally, has anyone (outside Ottawa) been using the board enough to provide a mini-review of it?

Thanks in advance for any info anyone can provide me.

Nope! The fence is not high enough for the drive-in movie, and the
people at the next table should just sut-up and stop all the acoustical
interference. :-)

Q: But how about on good microwave links where S/N is high?

A: Things far better than 19.2 kb can be done.

**** UoSAT-OSCAR-11 BULLETIN 24 October 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-13

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue to 261290. The spacecraft attitude is:

BLON = 180 and BLAT = 0

** AO-10

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and

transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder. AO-10 may be able to to support Mode-B transponder operation in November.

** AO-16 PACSAT

The microsat BBS has been tested on the ground engineering unit, and is now ready for uploading to AO-16. The satellite BBS software was written by Jeff Ward, G0/K8KA, at UoSAT and was ported to the microsats by NK6K. The porting was easily achieved, as there are only 10 lines of code that are different between the UoSAT version and the Microsat version. A lot of effort went into the design of the BBS, operating system, and other support code to make that possible. Once complete, the following elements will be available:

256k file system:

This is just half of one of the four available banks of bank switched memory. The more complete file system using all four banks and the 6MB mass memory will be uploaded after more testing.

FTL0 file server:

This implements the protocol described in the FTL0 document, available on CIS, the 9th ARRL Networking Conference proceedings, and elsewhere. It allows file uploading, downloading, and a simple directory display. It requires the use of software at the groundstation: a simple version, called "PG" has been written by Jeff and will be on CIS soon.

Broadcast server:

This implements the broadcast protocol as described along with FTL0 and has been running for several weeks on UO-14, and a few people have rolled their own receive program, at least one written in BASIC. A simple version, called "KISSUI" has been written by Jeff and will be on CIS soon.

After this is loaded, the following separate programs will be running on AO-16:

Kernel - Operating system - NK6K/Quadron
AX25   - AX25 driver - NK6K/WB6YMH/Quadron, pd on a KA9Q AX25 implementation.
PHT   - Spacecraft control, power management & program loader - N4HY/NK6K
AARTD - AART driver - NK6K/WB6YMH
MFILE - File system - G0/K8KA/UoSAT
FTL0   - File upload/download - G0/K8KA/UoSAT
PBP   - File broadcaster - G0/K8KA/UoSAT

** $BID **
Please use BID $UOSAT.1024 for PR BBS use.

Keizer) writes:
|> At 9600 baud, what amount of
|> bandwidth is being used? as compared to 1200 baud?

The K9NG-type 9600 bps modems (which includes G3RUH, etc) occupy
roughly the same bandwidth as standard 1200 bps AFSK/FM: 15-20 KHz.

This is not because the 9600 bps modems are especially efficient, but
because 1200 bps AFSK/FM is incredibly INefficient. Roughly the same
signal power is needed to make a 9600 bps modem work as to make 1200
bps AFSK/FM work, but the signalling rate is 8 times faster. That
translates
directly into a 9 dB improvement in both Eb/N0 (S/N) and in bandwidth
utilization.

If we hams had to pay for the spectrum we burn up, I suspect that we'd
have
had much greater acceptance of newer modems...

Phil

MFILE  - File system - G0/K8KA/UoSAT
FTL0   - File upload/download - G0/K8KA/UoSAT
PBP    - File broadcaster - G0/K8KA/UoSAT
```

[Story via OSCAR-11]

* OSCAR-13 NEWS *

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

```
Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis  : MA 220 to 040
```

This schedule is expected to continue throu 26-Dec-90. The spacecraft attitude is BLON = 180 and BLAT = 0.

Hi.

Boy was I surprised to learn that my new PSK-1 won't interface
with a Kantronics KPC-2. (according to the PacComm manual)

Has anyone been able to make these two units talk to each other?

Any suggestions would be appreciated...

This is a newsgroup that is piped through more than one automated mailing list. There are procedures for unsubscribing. These things should be known when you setup the subscription. Since you have mentioned the peculiar case of a new user using the same exact userid as a previous user, I guess you would not know of these things. I might suggest you contact the previous user to ask what was done in the past. The previous user should have unsubscribed all mailing lists when ending use of the account.

You need to look at the headers of the mail that is arriving there to find out where your mail is coming from. If there is a mention of LISTSERV in the headers, take note of the hostname where it is coming from and the exact name of the mailing list. You need to send mail to the LISTSERV address (so the server will read it as a command instead of sending it to the rest of us). In that mail put:

    unsub listname

and that should do it. If the mailing list is not a LISTSERV one, then find the name of the list in the header and add the string "-request" to the name of the list, but before the "@", and send mail to the request address you just formed. In that mail, simply ask to be removed from the mailing list. There may be a few days delay in processing since there is usually a human being doing this and human beings often have bad days at the office and take extended vacations.

>
> A: Things far better than 19.2 kb can be done.

But if S/N is truly so high (not just guard to cover QSB etc) why not use it with an appropriate modulation method to obtain greater channel capacity? If S/N is unnecessarily high it means you have already wasted (not optimumly used) some hardware resources.

  But better than turning up the bits/baud turn up the bandwidth since that gets you more channel capacity than trying to cram a lot signalling info onto a narrow channel(inter-symbol interference problems). If you are using reasonably directive antennas the extra spectrum isn't "stolen" from someone else's use since frequency reuse can be going on anyway.

To: Phil Karn (KA9Q)

Phil, I don't know if you are alerted to this problem, but a while ago I grabbed a version of your TCP/IP program for MS-DOS off of louie.udel.edu

I don't know if it is the current version, but we experimented with it, and we found that doing SLIP between three machines at various bps rates your SLIP implementation appeared to work flawlessly except that it would not transmit binary files correctly. We had everything set 8N1, and the files arrived the same size as they were originally, but they were no longer binary files. Do you have any reasons for this? Is this a new found bug? Or isn't that the most current version on louie.udel.edu, and if not, where can I get the most current version?

Just some questions...

Thanks in advance...

Digicom is actually a small board that attaches to the C64, and allows
one to operate packet radio. It only costs about 40 dollars to build.

This information is about 8 months old, but here is what I have:

Craig Rader N4PLK
922 Baltimore Dr.
Orlando, FL 32810-5531
(407) 629-2965

Here is another number - I think this person wrote some different software
to operate the Digicom:
Barry Kutner
614-B Palmer Lane
Yardley, PA 19067

Although it came up in conjuction with some discussions of net/rum networks, the question of how to choose a value for the slottime of a slotted p-persistent CSMA TNC is one that has a wider application, since KISS TNCs use that method as well.

A quick literature search yields the suggestion that the slottime needs to be long enough to make sure that a transmitting station is detected by all the stations that can hear it - that is, the slot has to be wide enough that if station A begins transmitting in station B's slot s, assuming that station B does not transmit, then when station B again samples the channel in slot s+1, its carrier detect circuitry must have already noticed the channel activity.

It seems to me that this would have to include the transmitter keyup time, receiver unsquelch time (if a squelch is being used), and modem PLL lockup time. Most ham transmitters get on the air reasonably fast, and the modems in current use aren't too slow, but some receiver squelches are. Thus many people use transmit delay times in their TNCs that wind up sending around 200 to 300 ms of flags before they begin sending data (i.e., a TXD setting of 20 to 30). That's probably two to three times longer than is needed, but since there is little hope of ever correcting that in the great unwashed populace, those long delays need to be taken into account when configuring anything that's going to be on a general-access channel.

Net rom arrives with a default slottime of 100 ms. For a 1200 bps channel like most two meter channels, I think that's way too small. Assuming that the TNC in which the net/rom is installed is equipped with Eric Gustafsen's DCD mods (as available from TAPR), that's probably fast enough for itself to avoid colliding, but there will be a lot of other TNCs on the channel that wouldn't have detected carrier that fast so it's perhaps best not to sample quite that often - in other words, to enforce a bit of deadtime by making the slottime longer. That way, the TNC using ppCSMA won't wind up getting stomped on by the older TNCs.

Thus I think that a slottime of around 250 to 300 ms is reasonable
for 1200 bps AFSK like most 2 meter user channels.

Any thoughts or experience on this?
     - Brian

The source is tightly controlled by the author (Howie Goldstein) and will
almost surely never be released by TAPR. This is NOT under TAPR control.
Have you tried sending KISS command 255. This command means exit kiss and
is standard in all kiss implementations I know of.

>A couple of questions about the nifty-looking packet board from the Ottawa
>group:
>
>1) Can one pc support more than one of these boards? IE, can we run two
>56KBPS (or whatever) links on a single machine?

In principle, yes... but we haven't tried it yet, and we can't make any promises to support multi-board configurations. The board is intended to fill a fairly specific niche: for the end user who wants to run 56kb, or for a small packet switch which has a single high-speed trunk and a plethora of lower-speed ports. Multi-board applications run up against some pretty severe constraints (e.g., lack of DMA channels and IRQ levels) of the XT bus.

>2) Is the low-speed port an asynchronous one, or can it also be used to
>directly drive a modem? And if so, at what maximum speed?

Directly driving a modem is the intended application for this port. The maximum speed is yet to be determined - we've only tested it at 1200 bps so far. Unless someone can make a convincing case for it, support for using it as a general-purpose async port probably won't happen.

>3) If the low-speed port is a standard serial port, can it be addressed
>as COM3 or COM4?

Even if the async support software materializes, the port would not be addressible as a standard com port.

>4) Is anyone working for a driver to use this board with the
>G8BPQ netrom code? NOS is fine with me, but we have a switch site where
>we'll be using BPQ at least for a while.

Not yet, but the technical details of the board and the NOS driver haven't been released yet. As a TCP/IP devotee, my feeling is that you're better off to run NOS in your switch. You can always hang NET/ROM TNC's on the low-speed ports to keep the ax.25 users happy. That's what we're doing in Ottawa.

>5) Finally, has anyone (outside Ottawa) been using the board enough to
>provide a mini-review of it?

I don't qualify, but I can tell you that the answer right now is no. We're waiting on the PCB shop right now, and the first shipment of PI boards is still a couple of weeks away.

I finally managed to compile NOS with the unix TUN driver hacks,
and it appears to be working (thanks to Gnu C). Now I need to configure it.
My Packet IP address is [44.2.1.17], and my ethernet has [138.9.100.1].
My internet subdomain (to be connected some day. Don't worry, I won't
try to gate inet and packet) is 138.9.100.x

Well, any suggestions addressing the two ends of the tun device,
and the ax0 device? I want to run this thing in the background
and use the normal sun daemons and network utilities. Any
great ideas? I have the net documentation, but it's not very
clear.

Since most of the nos package seems to be support for user commands
and daemons, nos may be overkill, but as long as it works, I'll be
happy.

Thanks in advance.

>files. Do you have any reasons for this? Is this a new found bug? Or isn't
>that the most current version on louie.udel.edu, and if not, where can I get
>the most current version?

Since all the underlying TCP and IP protocols and headers have binary data,
if SLIP was not completely transparent, TCP/IP just would not work at all.

What method of file transfer did you try?

If FTP, you need to use a command like:

    type image

or

    binary

otherwise the transfer is text mode and that mode will translate CR/LF
and NL between machine types and many other things as well.

Brian,
  I'm the editor for the North East Digital Association which is based
in New York and New England. Our Annual Membership Package suggests
30 for slot time for TheNET node user ports. The Slot time for
hidden transmitter free backbone ports is determined by the worst Tx/Rx/Tx
speed (I'd have to check to see how closely that has been followed on
the existing links).

   Thanks to all those who have replied. We are aware of the KISS
"param ax0 255" command, and this works fine on the version 1.1.7
ROM which we have. The particular 1.1.6 version that we tried has
a mailbox, which we figure could be handy (if we aren't running TCP/IP),
but, as I said, the only way out of KISS as far as we can see is to
disconnect the backup battery and power the TNC down. The normal
code then executes on restart. I will disassemble the KISS code and
compare it to the KISS sources I have, and see if I can get it to
work that way.
Thanks again,
....Ron

I recently purchased a Regency HR-212 crystal transceiver. This rig
did not come with a manual. I want to use it as a dedicated packet
transceiver.

Is anyone out there using one of these? If so I really need a copy
of the wiring diagram from the HR-212 mic connector to the KPC-2.
Any other hints on tuning this thing up for packet would be appreciated.

Hi Ron:

How does your ZMP relate to Packet Radio so far? I recall something about
an overlay for this when going thru my ZMP docs. . .

SB SPACE @ ALLBBS < KD2BD $SPC1105
* SpaceNews 05-Nov-90 *

Bulletin ID: $SPC1105

=========
SpaceNews
=========

MONDAY NOVEMBER 5, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* PIONEER 11 STATUS *

The Pioneer 11 spacecraft emergency support continues with 70 meter antennas in high power transmitter uplink configuration. Non-coherent downlink telemetry has been processed by the Ames Research Center. Following the uplink with the 70 meter antenna in Spain on 28-Oct-90, the 70 meter antenna in Goldstone was unable to acquire 3 way downlink. The project at Ames reports commands are getting into the Pioneer 11 spacecraft, but the planned receiver swap was not successful.

[Information via JPL]

* MAIL BAG *

I've been receiving quite a few questions recently about DOVE-1/OSCAR-17. First of all, DOVE transmits on a frequency of 145.825 MHz FM. This downlink carries spacecraft telemetry (AX.25 AFSK packet radio format) as well as synthesized voice transmissions. To date only telemetry has been carried on DOVE's downlink as spacecraft testing continues. After new software has been loaded and tested on DOVE, the Votrax speech messages should be heard. It should also be mentioned that DOVE-1 does not have mailbox capabilities. It was designed primarily for downlinking digitized voice messages to Earth.

Q: Could you carry Keplerian orbital data in SpaceNews?
A: Since there are other outlets for Keplerian orbital data, I would rather not repeat that information here. (Sorry!)

Q: Are they any satellites that I can access with an HT?
A: Well, you could get a signal into RS10 or RS11 on Mode A with nothing more than a handheld 2-meter transceiver if you were to key the PTT button with CW, but this usually results in a very chirpy signal! FM and other "constant carrier" emissions should be avoided when communicating through amateur satellite transponders.

Q: Is "SpaceNews" associated with the trade journal "Space News"?
A: No. "SpaceNews" has been in existance since November 1987. It is dedicated to topics of interest to Amateur Radio operators worldwide and is non-profit publication without connection to any organization, public or private.

* OSCAR-13 NEWS *

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue throu 26-Dec-90. The spacecraft attitude is BLON = 180 and BLAT = 0.

* TNX QSL! *

There is a NOS manual on thumper.bellcore.com:pub/ka9q/docs/userref.nr.
I just looked and saw some other files there too, I don't know about
those. There are other hosts too, some probably have more docs.

~~~~~~~~~~~~~~~~~

Initial guidelines for the Microwave and RF GROUP Conference.

1) As of present, this conference shall be open ended. As things progress, we'll see how the Conference is developing and then determine if there is a need to fine-tune our scope of discussion.

2) It is possible that this Forum may become an important motivator of the Microwave and RF industry as a whole. Ideas shared in one place strangely seem to find their place in an application later on. Discussions on this forum and the contents of all message traffic promulgated herein are declared Public Domain. Furthermore, this conference is a Public Conference and makes no provision for private messages.

3) The Owners/Operator of RES-Q (TM), hereby declare themselves not responsible in any case of posted information which may be proprietary, confidential or secret. In any such case, liability shall be reverted to the originating BBS's owner/operator and poster. RES-Q (TM) will in no way be responsible for filtering such information but retains the rights to do so.

4) Participants of the Microwave and RF GROUP Conference are solely responsible for what they do with information obtained from the Microwave and RF Conference. RES-Q (TM) makes no warranties express or implied as to our performance as Top Star for this GROUP.

5) Access to the Microwave and RF GROUP Conference is not restricted. A professional, yet congenial, atmosphere is desirable.

6) The Microwave and RF GROUP Conference may not be "ported" outside of GroupMail without prior consent of RES-Q.

7) Finally, let's make this Conference one of the Top 5!

Your Moderator is Bill Kreps

   The current version of ZMP (1.6 I think -- it's been so long that I've
lost count) did YAPP transfers successfully for small files. The problem
began when the file was too big for the receive buffer: since there's
no hardware standardisation in CP/M, and I haven't implemented
CTS/RTS handshaking yet, there's no way to stop the TNC sending data.
I am thinking about a new ZMP version, so maybe that'll get done at the
same time.

I have the CNC proceedings which describe the Heatherington (WA4DSY ??)
56kbps modem and am looking for more detailed constructional details.

Would somebody please point me to a source of circuits and / or PCBs ?

I've seen many references to these modems in postings from US packeteers -
is there anyone in the UK using them ? Or anything faster than 9600 bps ?
Or is there some legislation that stops us ?

Thanks,

-adrian (G7HWN)

Would some kind soul please explain how to use the NNTP function in
G1EMM.

I set it up using my own system as a host, as well as another's, but
both times ,after kicking NNTP, got the msg:
NNTP daemon entered, tagget = kc2yu
NNTP kc2yu:nntp Connect failed: Reset/Refused

What am I missing?

If you take it to the FCC lab and get it type accepted, yes.

I only have seen a package of overlays for 1.6 locally. CanI get the 1.6 ZMP
from Znode 62?? Or where can I get it if Lindsay doesn't have it?

Thanks to all those who replied to my request for help on BBS software.
:-) I received volumes of very useful and informative comments and opinions!

We are currently evaluating MSYS V1.08, and it seems fine ! the only problems
we've had so far are small but annoying. Specifically

- When mail is received by MSYS via SMTP, the subject is the dest address
  ie in BM send mail to ALL@VK5NET, subject on MSYS becomes ALL@VK5NET.

- When you do that, and the distribution tables tell MSYS to send you back
  messages that are @VK5NET, you get it back again, etc etc etc etc ...

- How do I get bulletins addresses to ALL@VK5NET sent to my NOS node as
  VK5ZEU@VK5ZEU ?, ie can we spray the bulls out to all SMTP nodes addressed
  correctly ? or to a second address at that node eg BULL@VK5ZEU ?

- Does MSYS support SLIP ? a config file that was distributed with it suggests
  that it can, and defines a port as 'name slip link' but the only way we
  can even get it to look like its working to a NOS node is to setup the NOS
  for AX25 as the link type. So is it SLIP or just 'SerialAX25', it doesnt
  matter to us, but it doesnt say anything in the manual that we can find.

- Is telnet only for chat, can you connect to MSYS BBS using Telnet ?? we
  havent succeeded in doing it so far, again the manual isnt very specific...

- Is there any option for providing Xmodem download? Not that we will want
  this feature after there are more than 2 of us on IP, but as a kick start
  for people to get the code, it would be handy.

On these last 2 points, It seems strange that a BBS that is IP capable, would
have only AX25 BBS connections, surely where people are using IP, they have
their own freq allocation, and pure IP traffic would be preferrable to
having ax25 and IP mixed ??

** We would also like to evaluate W0RLI BBS, so if anyone has an FTP site
listed for it, I'd sure appreciate it if you could forward the sitename on !

Yes, it's puzzling to me too that the MSYS bbs can't be accessed with

TELNET; it's a wierd shortcoming.

You'll note an interesting protocol violation when you disconnect from the MSYS AX.25 port; you ALWAYS get a retry. That's because the program goes into disconnect mode BEFORE it acknowledges the packet containing the disconnnect; you then time out and resend the packet and get a DM back that actually disconnects you. It's bizarre - it's apparently taking a shortcut in the protocol state machine somehow. Minor.

There are also some other wierdnesses - but nothing major. I suspect that if the author of MSYS were to distribute the source, he'd find a LOT of people who'd make some really nifty additions to it, and fix the bugs. Dunno whether it's that he's hoping some day to make money off it, or whether it's just the fatherhood thing. It's a nice piece of work. There are several of them running in SoCal.

What I've been experimenting with lately is running G8BPQ on a PC to provide the unwashed with a familiar interface, but having one selection be "NOS", and allowing access to NOS running on the same host that way. Thus unsophisticated users see something approximating a net/rom node that they can use in a simple and straightforward manner, but the more adventurous can connect to NOS and get to telnet, the mailbox, etc. This is a nice way to do it because I can customize NOS any way I need to, and I don't need a multitasker. Furthermore, by making the NOS console remotely accessable, I can start and stop NOS whenever I need to without damaging the ability of the site to continue to forward net/rom traffic - essential in virtual-circuit networks that can't route around outages.

- Brian

I was looking through the floppies that came with my DRSI board the other day and noticed one marked PC/ROM by G8BPQ. Is this software supposed to give functionality equivalent to NET/ROM or TheNet software? If so, how does one set it up? The documentation isn't all that clear--or maybe I just don't understand!

Thanks in advance.

73,
Bob K2PH

As quoted from <15653.27358b90@levels.sait.edu.au> by xtasc@levels.sait.edu.au:
+---------------
| We are currently evaluating MSYS V1.08, and it seems fine ! the only problems
| we've had so far are small but annoying. Specifically
+---------------

MSYS is currently at 1.09 and has at least one patch available over that.
(I'm quite certain of this; see my .sig for the reason.)

+---------------
| - Is telnet only for chat, can you connect to MSYS BBS using Telnet ?? we
| havent succeeded in doing it so far, again the manual isnt very specific...
+---------------

Only for chat, I fear. I'd like this to change as well.

+---------------
| - Is there any option for providing Xmodem download? Not that we will want
| this feature after there are more than 2 of us on IP, but as a kick start
| for people to get the code, it would be handy.
+---------------

I've been noodling this; the problem is that AX.25 TNCs can't deal with binary data except in KISS mode --- in which case you probably might as well be running NOS or MSYS anyway. And even if you did, anyone monitoring the frequency is going to have *weird* things happening to their display while you're downloading a binary file.

The best way to deal with this is to allocate an AX.25 protocol value for AX.25 binary file transfer, and arrange for TNCs to translate such packets to and from some common protocol like x/y/zmodem or Kermit. Or a simple KISS mode program that emulates such a TNC.

```
+---------------
| On these last 2 points, It seems strange that a BBS that is IP capable, would
| have only AX25 BBS connections, surely where people are using IP, they have
| their own freq allocation, and pure IP traffic would be preferrable to
| having ax25 and IP mixed ??
+---------------
```

"Surely" not. We run TCP/IP, NET/ROM, and straight AX.25 on the same frequencies around here. This probably had a big effect on how MSYS was written.

(P.S. Send me netmail and I'll see if I can get it to Mike.)

I wish to ask a fundamental question. Why are there so many questions on this
newsgroup (and the Fidonet HAM and PACKET echoes) on "How do I plug in the
power cord?" or "Why isn't the documentation more specific on whether the
machine screws tighten clockwise or counter clockwise?"

When I was a baby ham, almost the only documentation was the circuit diagram.
We studied that. Maybe poked around "The Handbook", and then tried it. If it
smoked, plunged the whole block into darkness, or made the cat's tail stand up
straight, we knew we were headed in the wrong direction. If some Old Fart
said, "There's a lid tuning up on the frequency", we knew it was "getting
out".

Come on, guys, take a chance. Live a little.

Glad you saw it, Ken. I had you in mind when I posted it.

First, it orginates (Sure!) originates as a groupmail conference in a fidonet technology net. Groupmail is somewhat analogous to a moderated newsgroup. I was planning on gatewaying it into a mail list until and unless there are enough takers to warrant setting up a newsgroup.

Of course, if you have a Fidonet compatible mailer (FrontDoor, Binkleyterm, SEAdog, D'Bridge, etc., and GROUP.EXE, you can pick it up directly from the moderator.

Help!!

I was out in the CQ WW recently and we used K1EA. Because this was our first time using a computer on site, we decided to use it off-line. I must say the program is brillant, and I cant wait till the next contest when we use it on line....

But we were running it on a PC with only 640K and once we broke the 5,000 QSO mark the thing ran out of memory.

So, I got a PC with 2 Meg's of memory and went to throw the rest of the contacts in and when I loaded it up - I got a screen which looked like : -

```
  0 ALL                   0   ________
```

```
  0 ALL                   0   ________
```

When I type in a call, the line flashs up as normal once I press the
return key, and goes back to the ALL thing again.

Now, the date for sending in the log is getting closer all the time and
a few members of the group are getting nervous, so :

- Is there something wrong with my PC??
- Is there a bug in the copy of the program I have,
- or, have I done something to upset the program (I did reinstall it from
      the original disk....)

I would be most grateful if someone could help or susgest something which
I could try and any comments could be helpful.

Thanks in advance,

John, EI7DNB

I would prefer e-mail but additions to the digest is fine.....

   Perhaps I have it all wrong, but it seems to me that (unless you
convert the file to ASCII, in which case it takes twice as long to send),
ANY binary file transfer (YAPP, XMODEM, TCP/IP or whatever) is bound to
put *weird* things on the screen of anybody monitoring the frequency.

If they don't like it, they have several choices:
1. Turn their computer/terminal off and go and watch TV;
2. Only monitor packet types and not the contents as well (the MYOBB
   approach);
3. Put useful things like ESC and screen-clear sequences in the MFILT
   list.

I would have to say that kc2yu is not running an nntp server. The

standard G1EMM (and KA9Q and PA0GRI as well) do not contain
NNTP servers, only the NNTP client. If you want to add an NNTP
server to nos, get pub/ka9q/incoming/nn901027.zip. It was
developed using KA9Q NOS, so I would be glad to hear how it 'ports'
over to G1EMM.

**** UoSAT-OSCAR-11 BULLETIN 06 November 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-16 / UO-14 BBSs COMMISSIONED **

The Packet Bulletin Board software which has been running in 'beta test' versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This follows a period of intense development by Jeff Ward, G0/K8KA, and Harold Price, NK6K, getting software ready for hundreds of users expected to access AO-16 and UO-14.

The programs loaded to the satellites, when combined with several groundstation client programs, implement the PACSAT communications protocols proposed by Jeff and Harold in papers presented at the recent ARRL Amateur Radio Computer Networking Conference. The protocols provide a connected-mode file transfer facility called FTL0 and a standard broadcast mode for bulletins and other items of general interest.

When someone is up or downloading in connected mode you will see packets from the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14). Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11. These packets may contain some ASCII text, although each will begin with a short binary header.

The PACSAT protocol suite requires special groundstation software to interpret binary headers and implement protocol handshakes. Papers in the 9th ARRL Networking Conference proceedings describe the protocols in detail. Software for groundstations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the groundstation software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following stortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

** RS-14/RUDAK-2

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

** AO-13

The transponder schedule is as follows:

Mode B : MA 000-095
Mode-JL: MA 095-125
Mode-LS: MA 125-130
Mode-S : MA 130-135
Mode-BS: MA 135-140
Mode-B : MA 140-256
Omnis : MA 220-040

This schedule is expected to continue through 26 Dec 90.
BLON = 180 and BLAT = 0

** $BID **

Please use BID $UOSAT.105 for PR BBS use.

/EX

Brandon, Ed Greenberg and I swap files often by using UUENCODEd data. It's not a terribly inefficient technique if you make a ZIP of the files you want to send, then uuencode it, then just dump and capture the data stream. AX.25 is generally an adequate protocol for data protection, I wouldn't even be too concerned about verifying the data. However the ZIP file format also has check codes to insure file integrity.

I've finally ordered the DSY 56 kbit modem - now it is just to wait..
and wait.. and wait (hopefully not for long).

To save time, I'd like to order the necessary frequency determining
crystals in advance. So, please, someone with the documentation handy,
e-mail me how to determine the frequency and type of the crystals.

If you know a reasonably-prized place to purchase them, it would be
appreciated as well.

Thanks,

     Luru

+
+If you take it to the FCC lab and get it type accepted, yes.
+

None of the existing Amateur gear could pass..the controls allow for other than fixed-transmit frequencies. The power output is adjustable above the limits, the modulation can be run above limits, most rigs have FM - a mode that is illegal...nope, you couldn't get it type certified; it just won't qualify! The rules were designed to force the manufacturers into selling radios without those capabilities, and of such design that it is difficult to add such capabilities...like why do you think that Dynascan/Cobra keeps on making the Cobra 148GTL??? Because it's *very* easy to modify...and that's why people keep on buying them! Because of the way in which the rules were written, once a design is type certified so long as there are NO CHANGES, the company can keep producing and

selling them..if they change something it's a new set of rules! The latest set insists on making it damn near impossible to modify the rig for increased frequency coverage (the '148 can go from 26.965-27.405 to 26.815-28.045 with just 3 silly jumper wires and 3 switches added to the existing PLL!) more power (the '148 can be turned up to almost 20w PEP SSB and 10-12w RMS for AM use!) or additional modulation modes. (again, the '148 can be made to do FM by adding a little kit that costs $20!)

In addition, it's pretty obvious that the manufacturers would rather sell millions of radios than thousands...hence they decided to do both by building units like the HR-2510/2600 - Ham radios...sure! A simple jumper, a cap or a new PLL chip and either of those units can operate on 26.00-30MHZ...presto! ..no type acceptance laws to worry about! It's NOT a CB! Yeah RIGHT!

The FCC hasn't got the time to bust hams for running their gear on 11 meters, and your risk-factor is small PROVIDED:

1) you DO keep it turned down to 3 or 4 watts RMS - otherwise you stick out like a sore thumb! Just like the guys that run linears only cleaner! ..if your antennas are really good on 10 & 11, crank it down more!

2) Watch your modulation % - most stock CB's have 65-70% max...a preamp mic (I use the Cobra Dynamic Plus..) turned DOWN to 2 or 3 will make you sound pretty much like a *verrrryyy clean* CB radio...most amateur mics sound pretty awful on AM..great for SSB but thin or hollow on AM, especially if the people listening to you are listening on CB receivers..which are not the greatest!

3) AVOID THOSE "funny freqs"...lot's of CBers insist on using the band between 27.405 and 28.0 You (as a HAM) should never operate there! You could lose your license in a flash! Most CBers never get caught..but I've know some Hams that have! A word to the wise...if they ask, just be cool..tell 'em you don't have "freqs"! Stick to the 40 channels...plenty of people to talk to there, besides some of the freebanders have been known to use their equipment for illegal acts - something you'd just hate yourself for if the FCC nailed you and decided that you were in on it!

4) You don't cause problems...TVI, RFI and the like, even complaints from other 11 meter users can be the catalyst for a complaint. Remember that most of the people on CB are non-technical, they tend to carry around a lot of misconceptions about the science of radio...don't abuse them for this: TEACH THEM! ONE AT A TIME! INVITE THEM OVER (if you trust them..) AND OFFER TO LET THEM BE A GUEST OPERATOR! YOU'LL BE AMAZED! Some of them will be so jazzed they'll go out and get a Novice ticket with a little encouragement from you! (I'm rather proud of the 12 people I did this with - they're good hams, they wern't bad CBers...)

5) Keep a low profile! The FCC is sooo overworked, and sooo underfunded it's unlikely that they will be doing much about 11 meters any time soon. They'd probably like to just ignore the problems there unless there is a reason to do otherwise...like those clowns that shout obscene remarks into their mics..or run a gallon of power...if you're cool about it, no

one will ever know you're running ham gear..unless you tell them! And if someone *does* ask..tell them you're running a Stock Cobra 148GTL with a power mic!...there's millions of those things out there and it won't arouse a bit of interest..

Posted: Wed Nov 7 15:27:13 1990

Here is the modification I made to my PAC-COMM NB-9600 modem. This mod got rid of all the garbage calls in my mheard list both when using the TNC in standard mode as well as while using net/nos software packages. This modification makes sure that the modem will send all zeros to the TNC until the modems PLL is locked on a signal. This means that the TNC will not be reading garbage comming in to the UART all the time.

I removed the socket for U11 (74HC14) and inserted the 74HC14 directly into the PC board. I then lifted all the pins of a 74HC00 except 7, 12 and 14. These lifted pins were carefully bent so they were pointing straight out. I cut back the bent pins so the 74HC00 can be piggybacked on the 74HC14. Without removing the socket on U11, I would not have ben able to slide the modem and Tiny-2 back into the box (you may not have this problem).

I cut the trace from U11 pin 12 to U20 (74HC157) pin 13. I soldered the 74HC00 on top of U11 (soldering pins 1, 12 and 14). I wired U10 pin 13 (LM339) to the 74HC00 pins 9 and 10. I wired 74HC00 pin 8 to pin 13. Pin 12 of U11 was connected to pin 12 of the 74HC00 when I piggybacked it. I connected pin 11 of the 74HC00 to pin 1 and 2 of the 74HC00. I connected pin 3 of the 74HC00 to pin 13 of U20 (74HC157). I think thats it.

Theory of operation:

The DCD signal comming from U10 (LM389) is low true so I invert it using
one of the nand gates (pins 8, 9 and 10). This is used to qualify the
RXD signal from the 74HC14 (pin 12). Pin 11 of the 74HC00 is the RXD signal
(low true) qualified by the DCD signal which is LOCK DETECT. One more
inversion of this signal (74HC00 pins 1, 2 and 3) and I have the qualified
RX DATA signal which is connected to U20 (74HC157) pin 13.

RX DATA is always zero until the PLL is locked to the data. Then RX DATA
will be the true data comming from the unscrambler or zeros if we are not
locked.

Before making this change, my mheard was always full of random garbage.
After the change, my mheard is clean and my RXErrors is not increasing
at a rate of about 200 errors per minute.
PAC-COMM said that their firmware uses DCD to determine if the channel is
clear and not to determine if the data is valid. This may not be true
for all versions of firmware available.

Anyway, there you have it. Three gates later and I am much happier.
The 9600 baud modem seems to work very well. I have not tested it under
any marginal situations. The other station (who also has the mod) is
about 4 miles away and the signal seems too strong to determine how well
the modem works under weak signals. From this distance I seldom see
a retry.

I am posting this for WD1V, the moderator of Macnet.
Please do NOT respond to this account.

Macnet is FREE and available to all. What WD1V has done is put together, via packet radio,is a list of hams throughout the world who use Macintoshs, so that they might converse about Macs and ham radio. He also maintains a Macintosh public domain software base for ham radio. Currently, the base is about 10 Megs! The following is his Invitation to Macnet as well as a list of the public domain software disk names. Send a SASE with a FORMATTED disk for the Macnet general info and the list of hams which WD1V has compiled. For each disk you want,send the disk name as well as a FORMATTED disk and SASE.

As soon as you send your stats in, you are a member of Macnet.

I would like to thank John WD1V for his efforts to bring together the Macintosh Ham community. He has done a very good job.

Please do NOT respond to this account. Contact John WD1V via packet radio at WD1V@KB4N.NH.USA.NA, or send a letter to the address below.

John Kingdon KA3VJH

My Kantronics TNC has a filter mode to delete all non-ASCII characters
when monitoring. Don't TNC-2's have the same feature?

I am setting a library of Public Domain Amateur Radio software for the Atari
ST range of computers. If you have anything relevant then please mail me. I
will supply floppies and postage costs etc for anything worthwhile. I if
receive anything from you I will try to send you something interesting in

return.

        Thanks in advance.

This might be a dumb response, too (I'm not exactly sure what you mean),
but 10 meter FM is a whole lot of fun, especially through repeaters ... it's
a whole different type of QRM and QRN that, to many people's ears, is just
as much fun but without the "SSB Headache" I get after a few hours of

over-used speech processing and tin voices.

I wonder if any of these FM radios allow you to work "splits" for repeaters.
I have heard many stories about eliminating the "skip zone" by using
repeaters - sounds like fun!

    Me too! I also remember the "negative reinforcement" method of
radio education... Like the time I left the 600V power supply open on
the floor of my room, came back from supper (the lights were off),
and _STEPPED_ on the thing in my bare feet! OUCH!

    Then there was the time that I learned that with a full-wave
center-tapped rectifier circuit, the ENTIRE PEAK VO
LTAGE of the transformer is across each diode, every half cycle. In
this case it was a 1000V, 1/2 amp supply for my

four-sweep-tubes-in-an-arc5 linear.... One of the diode stacks shorted
out, and every light in the house blinked at a 60Hz rate. Nice
effect, until the house fuse blew....

>>> Re "Microwave and RF Forum as a mailing list/newsgroup

I'd really appreciate it if this were possible. I tried to send some
mail to (I think) Jim Grubbs on Fidonet but it was bounced (even using
the REPLY command from the Usenet reader :-).

From New Zealand, Fidonet access via phone (I'm guessing - we don't have
it here) would be cripplingly expensive - like a choice between reading
the group and eating :-), whereas Usenet and Internet mail are already
available.

To Summarize: One (informal) "Yes" vote for either a mailing list/newsgroup.

Cheers
Giovanni - ZL2BOI

They won't be doing anything soon. The solution according to a fellow New Hampshireite in the current administration is to do nothing long enough for the QRM on HF to get bad enough for the media to notice it. The congress at the urging of the administration can then step in with public support and pull the plug on all, and he says ALL HF transmission. Mr HIGH UP in the POWER STRUCTURE knows I'm a ham and he said with a shrug that there will be no way to clean all private use of HF off the bands without including hams. The plan is to ban ALL private transmission. Then they don't have to go after specific violators they can just swoop around and RDF the easiest violators..by the thousands.. if necessary and pass out big,and he said BIG fines. No jail..no room, but,and these are his words...."The fine structure will allow a self-sustaining police action to continue as long as necessary without departmental fiscal impact." When I brought up the failure of the drug war he laughed and said "drug dealers are mobile. They are like rats. They hear you coming and can hide. And they don't have a lifestyle that can be damaged by big fines. You radio types live in houses and drive cars that can be attached along with your paychecks. Your lives can be destroyed by being caught on the air by a van with a couple of guys and the 'probable cause' of RF coming out of your house." And then because we went to college together and have been friends for a long time he said,"Sorry Dickie, we need the room, we need the money and the pressure from the commercial sector is building. You hams did a great job when we were young but there is nothing you can do now that is so valuable to the public that they can save you. I'm really sorry".

Then I asked about VHF/UHF and he thought that was really funny.

Porky said it all...."That's all folks"

Fellow packeteers,

I have been hunting for 70cm packet in the Chicago area.
I have not heard any activity.

I have also been listening for 2400 baud activity on 2m and 70cm.

Does anyone have any info.

((While this subject relates to packet, it is crossposted since))
((the nature of the question could impact non-packet operators.))

There are nationally and internationally recognized frequencies for DX purposes for Morse Code (CW) and voice (usually SSB) modes in the VHF and high bands. For example: 432.100, 1296.100, 2304.100 MHz

I'd like to know if there are any specially designated frequencies, or if anyone would like to have some so designated, for DX-ing on VHF and above in packet modes?

Clearly, use of the frequencies for Morse or voice DX won't go over very well as there will be lots of mutual interference, usually with the CW/SSB modes suffering. Using FM simplex calling frequencies is out. Except for some on 2 meters, there doesn't SEEM to be a national (USA) plan for packet simplex that is actually used in all areas (tell me if you know otherwise).

Should a packet DX frequency be designated from within packet subbands or from DX subbands?

Should there be different frequencies for different baud rates?
1200?
2400?
4800?
9600?
19200?
56000?
1544000?
10000000?

Should packet DX-ers coordinate on another voice frequency first as is a common practice by ATV DX-ers who use 144.340 FM to make contact before trying video? Should it be only on certain bands?

Packet DX could be a very interesting form of operating. Packet DX can make use of many of the short band opening propogation modes that usually go missed by manually operated modes such as Morse and voice.

Challenges include how much data one can pass through a band opening
before it closes again (maybe within seconds).

I understand that an experienced ham would get tired of simple questions.
However, those of us who are new hams ask dumb questions without knowing
that they're dumb. I hope that we don't discourage anyone from asking
questions on the net, for fear that someone will think it's "stupid."

... and I don't really buy the argument of "I learned about power supplies
when I stepped on a 600V one accidently. Ouch!" We learn a lot from the
"school of hard knocks", but frankly, I would rather someone tell me
something on the net before I get electrocuted.

Subject: RADIO-M1: CW-Telemetry Equations

de DB2OS @ DK0MAV

Info from AMSAT-U:

               TELEMETRY OF "RADIO-M1"
               -----------------------

Radio-M1 transmits Morse code (CW) and digital telemetry.

CW telemetry will start as soon as the bird separates from
the launch vehicle and Radio-M1 equipment will be powered by
main satellite power system.

CW Morse-Code telemetry frame consists of the registration
call RS14 and  8 four-digit lines in the following format:

     RS14  1A 1B 1C 1D
           2A 2B 2C 2D
           3A 3B 3C 3D
           4A 4B 4C 4D
```

5A 5B 5C 5D
6A 6B 6C 6D
7A 7B 7C 7D
8A 8B 8C 8D

The 1A to 7A lines are analog telemetry data. Line 8A is calibration engineering parameter.

The first digits from 1A to 8A are system status data:
figure 6 means general operating status
figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are numbers of line (channel).

The third and fourth digits from 1C to 8D are analog telemetry datas.

Table of meaning and decoding parameters

No of line	Parameter	Formula	Unit
0	Transponder power output	0.05N	Watt
1	Transponder PA Temperature	N	Grad. C
2	+24 V Regulated	N	Volt
3	+16 V Regulated	N	Volt
4	+9 V Regulated	N	Volt
5	+24 V Regulated	N	Volt
6	Inside Temperature	N	Grad. C
7	Service	N	*

Example:

RS14

6080	-	4 Watts	-	general
6137	-	37 Grad. C	-	general
6224	-	24 Volts	-	general
6316	-	16 Volts	-	general
6409	-	9 Volts	-	general
2524	-	24 Volts	-	command
2632	-	32 Grad. C	-	command
2700	-	0	-	command

SB SPACE @ ALLBBS < KD2BD $SPC1112
* SpaceNews 12-Nov-90 *

Bulletin ID: $SPC1112

SpaceNews

MONDAY NOVEMBER 12, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* ARIANE LAUNCH *

An Ariane launch on 20-Nov-90 will carry two spacecraft manufactured by GE Astro Space in New Jersey. The two satellites are Satcom C1 for GE American Communications and Gstar 4 for GTE Spacenet. Final launch preparations are taking place. The launch window will extend from 6:15 to 9:30 PM EST.

* PACSATs ON-LINE *

The Packet Bulletin Board software which has been running in 'beta test' versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This follows a period of intense development by Jeff Ward, G0/K8KA, and Harold Price, NK6K, getting software ready for hundreds of users expected to access AO-16 and UO-14.

The programs loaded to the satellites, when combined with several ground station client programs, implement the PACSAT communications protocols proposed by Jeff and Harold in papers presented at the recent ARRL Amateur Radio Computer Networking Conference. The protocols provide a connected-mode file transfer facility called FTL0 and a standard broadcast mode for bulletins and other items of general interest.

When someone is up or downloading in connected mode you will see packets from the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14). Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11. These packets may contain some ASCII text, although each will begin with a short binary header.

The PACSAT protocol suite requires special groundstation software to interpret binary headers and implement protocol handshakes. Papers in the 9th ARRL Networking Conference proceedings describe the protocols in detail. Software for ground stations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the ground station software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following shortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

* SALYUT-7 NEWS *

The presently unused and long abandoned Soviet space station 'Salyut-7' is tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere in mid-January. Attempts to boost the 60 metric ton structure to a higher orbit have failed. Salyut-7 should produce quite a spectacular light show if it re-enters the atmosphere away from sunlight.

Here is element set 630 for Salyut-7 as released by NASA on 08-Nov-90:

```
Epoch    : 90 310.56350817
Incli    : 51.5998
RAAN     : 295.9675
Eccn     : 3.895E-04
ArgPer   : 71.5486
MeanAn   : 288.6002
MeanMo   : 15.81020057
Decay    : 8.7992E-04
Orbit #  : 48723
```

* RS-14/RUDAK-2 NEWS *

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

That wasn't the intended thrust of my question. I intended to convey this:
"How do people get their licenses without learning enough to answer at least
some of their own questions?"

My own perception is that, for example, anyone with an Extra Class license
really ought to be able to read a circuit diagram well enough to tell which
pin goes where on a mike jack and similarly elementary questions. A Novice?
Maybe not. An Extra? Certainly!

RADIO-M1/RUDAK-2

The joint work of AMSAT-U and AMSAT-DL for creating the set of equipment for the satellite RADIO-M1/RUDAK-2 is completed.

The idea of the cooperation between two groops in the USSR and Germany appeared in the spring 1989. The discussion about what and how it is necessary to do lasted till the meeting of the representatives of two groops in Surrey in July 1989 when

the mutual preliminary agreement about the cooperation was signed.

The final version of the agreement about the cooperation was signed in the autumn 1989, when the work over the project was being done.
According to the mutual agreement the group ORBITA AMSAT-U develops and makes the linear transponder, command radio link, telemetry system, power supply system and decides all the questions with the official organisations about the placing of the equipment and launching.
The RUDAK group of AMSAT-DL developes and makes the digital part so called RUDAK-2. This part includes a digipeater and a mailbox (protocol AX-25).It also provides other possibilitys for the experiments on the transmitting of the information using modern digital methods. It also contains input and output RF circuits.
The complete set for ground command station is developed by Amsat-U-Orbita and Amsat-U-Sputnik groups.Rudak group brings special digital part for it.
During the launch and orbital test period ground command station will be situated in Molodechno at UC1CWA and in Moscow at RK3KP. The ground command station for Rudak-2 only will be situated near Munchen-DK1YQ and near Hannover-DB2OS.

The final agreement was signed:
from the side of AMSAT-U-ORBITA the technical director of the project "RADIO-M1" - V.Chepyzhenko - RC2CA;
from the side of AMSAT-DL - the president of it K.Meinzer - DJ4ZC.
The coordinators of the project are P.Guelzow - DB2OS and L.Labutin - UA3CR

SPECIFICATIONS OF THE RADIO-M1/RUDAK-2

Mission

Piggy-back onboard the USSR geological research satellite.

Launch and Orbit

1. Launch (scheduled)
   Time: Late of 1990, day is not fixed.

Launch site: North Cosmodrom Plesetsk

2. Orbit (planned)
   slightly elliptical polar orbit
   appogee: 1000 km
   Inclination: 83 degrees
   Period: 105 minutes

Satellite specifications

1. Dimension and shape
   Cylinder of hight about 4   meters
               diameter   1.8 meters

2. System configuration
   Professional geological research equipment, telemetry
   system, command link equipment, transponders and power
   supply, thermal control.
   Amateur linear and digital transponders, telemetry
   system, command link equipment, power supply.

3. Attitude control
   Satellite attitude will be maintained by the earth's
   gravity field by a rod 9 meters length pointing away
   from the earth.

4. Planned service life: 3 years

Radio-M1/Rudak-2 System specifications

1. System configuration
   Two sets of the equipment will be installed aboard the satellite:
   Linear transponder #1 mode B and RUDAK-2 with subsystems
   Linear transponder #2 mode B with subsystems
   The first set is concidered to be the main. The second one is
   reserve. It can be taken into operation in the case of
   failure of the first one.

2. Commands

   Equiped with real-time program command function

3. Beacons and telemetry #1 set

CW telemetry 8 channels	145.822 MHz	0.2 Watts
Digital telemetry 30 channels	145.952 MHz	0.4 Watts
	1100 bps,BPSK/FM, deviation 2kHz	
Digital telemetry Rudak-2	145.983 MHz	3.0 Watts
	BPSK 1200 bps AX.25 (like FO-20)	

4. Beacons and telemetry #2 set

CW telemetry 8 channels	145.948 MHz	0.2 Watts
Digital telemetry 30 channels	145.838 MHz	0.4 Watts
	1100 bps,BPSK/FM, deviation 2kHz	
Digital telemetry 30 channels	145.800 MHz	2.0 Watts
	1100 bps BPSK/FM, deviation 2kHz	

5. Transponders #1 set

(1) Linear transponder: inversely heterodined translator

Uplink passband	435.102 to 435.022 MHz
Downlink passband	145.852 to 145.932 MHz
Transmitter output max	10 Watts
Bandwith (3db)	80 kHz
Uplink EIRP required about	100 Watts

(2) Digital transponder Rudak-2: digipeater and store&forward packet communication (AX.25), telecommunications experiment with digital signal processing up to nearly 20 kHz, 1 MByte RAM disc, four separate uplink channels.

Uplink frequencies:	RX-1	435.016 MHz 1200bps,FSK,NRZIC/Biphase-M
	RX-2	435.155 MHz (AFC) 2400 bps,BPSK, Biphase-S
	RX-3a	435.193 MHz (AFC) 4800 bps,RSM
	RX-3b	435.193 MHz (AFC) 9600 bps,RSM
	RX-4	435.041 MHz (digital AFC) RX for RTX-DSP

Downlink frequency: 145.983 MHz 3 Watts

The downlink can be switched to the following operating modes:
Mode 1: 1200 bps, BPSK, NRZI,(NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (Oscar-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) +Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B),e.g. RTTY, SSTV, FAX, etc.(for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (speech)

6. Transponder #2 set

Linear transponder: inversely geterodined translator

Uplink passband	435.123 to 435.043 MHz
Downlink frequencys	145.866 to 145.946 MHz
Transmitter output max	10 Watt max.
Bandwith (3db)	80 kHz
Uplink EIRP required about	100 Watts

7. Antennas

(1) 435 MHz receiving antenna (shared by analog and digital modes):
Helix +3 db max RHCP.

(2) 145 MHz transmitting antenna:
Half wave dipol

8. Power supply

From main power supply system up to 100 Watts
Set #1 consumption 47 Watts
Set #2 consumption 40 Watts

9. Weight

Set #1 approx. 28 kg
Set #2 approx. 22 kg

10. Size: 480x400x300 mm^3 each set.

In rec.ham-radio.packet, Murray_RJ@cc.curtin.edu.au writes:
>ANY binary file transfer (YAPP, XMODEM, TCP/IP or whatever) is bound to
>put *weird* things on the screen of anybody monitoring the frequency.

We encountered this here in Rochester, especially with people who
like to leave printers online monitoring 24 hrs/day. One of us
had an IP address with a 12 in it (formfeed), I guess, and the guy
lost a whole box of paper in one night.

Isn't there also MNONAX25, which doesn't pass through anything with
other than a "no layer three" PID ?

I don't have a strong enough synonym for the word "idiot" to describe the schmo's who told me to stop using tcp/ip because it screwed up their screens. Every once in a while I think that, if I were the IP coordinator, most addresses would contain formfeeds, bells, and ANSI escape sequences to make the whole screen go into flashing mode. (Not really, it's just an evil thought that's crossed my mind :-)).

Chris

P.S. We just got PSI e-mail service -- anybody who reads this message, please send a response to cep@ccird7.cci.com I really want to know from what parts of the network this address is useful.

Hi all,

I've recently gotten very interested in getting involved with packet. I've read the ARRL book on packet so at least I'm familiar with the terminology.

My basic question is which TNC should I consider buying? I have a macintosh SE/30 and also a Toshiba laptop and probably would like to use both of these. I also have an IC-24AT and am wondering if I might be able to use this to at least start out with.

Although it seems that 1200 baud is what is mostly available, I can't imagine such a sloooow rate and would probably go out of my mind. (I'm spoiled since I have a workstation on my dest at work :) Anyway, I don't mind starting out at 1200 baud but would like to have an easy path to 2400 and preferably 9600 baud. Is there such a beast available?

Finally, if I'm interested in TCP/IP and require KISS mode, are'nt most TNC's overkill since it seems like KISS is almost a

straight connection to the modem.

Which brings up the final question. With today's PC's getting quite powerful, it would make more sense put all 'firmware' into software on the PC and drive the modem directly. Certainly my SE/30 is fast enough to do even 9600 baud. Does this exist or am I just dreaming?

Thanks in advance,
Tom

Sorry to digress, but I'm looking for information for a friend who wants to get a camcorder for baby pictures. She's torn between 8 mm and VHS. Anybody know of a newsgroup or mail list where I can find out more about the pros and cons of each?

How comprehensive is "comprehensive"? I would hate to see Novice level entry eliminated altogether. On the surface, it looks like your plan would do just that.

Also, I would reduce maximum power to 200 watts for everyone. There's no earthly need for more than that and hasn't been since hams quit operating on 600 or 700 meters with rotary spark gap transmitters.

Yes, they are. At the time we began our on-the-air experiments with TCP/IP, we (K3MC, WB6RQN and I) devised the KISS TNC only because we didn't all have HDLC interfaces directly on the computers we wanted to use. Adapting existing TNCs to the job seemed like an expedient, short-term solution.

We never expected it would become a de-facto standard. (Neither did the Canadians expect in 1979 that the then-already-obsolete-and-surplus Bell 202 modems they chose as a stopgap until better modems were ready would become the standard for all of amateur packet radio...)

|> dreaming?

It not only exists, but it is widely used. One company (DRSI) has a product line based almost entirely on HDLC adaptor boards that plug directly into PCs, making external TNCs (KISS or otherwise) unnecessary. Similar boards are also available from several other sources, including PACCOMM and HAPN. I travel with one installed in my laptop. I just plug the laptop into my Icom HT, and I'm on the air.

You're quite right. The "TNC" was an appropriate idea about 10-15 years ago, when even the most computer-oriented ham had at most a "dumb terminal", a 300 baud phone modem and perhaps a large S-100 system. Nowadays, with something like half of the ham population having more modern personal computers of some sort, the TNC concept is an anachronism that should be done away with, along with 1200 baud AFSK. But with an amateur population that still thinks of 1200 baud

packet as "fast" (perhaps it is, when compared to 60 WPM Baudot RTTY),
it's hard to make progress...

No problems for either. All you need is a simple terminal program.

>an easy path to 2400 and preferably 9600 baud. Is there such a beast
>available?

It's not so awful at 1200. I'm having a good time. If you want to ragchew,
of course it makes no difference what baud rate you're using, as long as
it's faster than your typing. :)

I have the understanding that 2400 is really a waste of time. The modems
are using the same protocols as the telephone modems, and they're optimized
for telephone connections where the frequency control is a little better.
Or so I'm told. But I don't know of much 2400 baud traffic here in San
Jose.

9600 on the other hand requires a much greater commitment and expense. The modulation technique in use currently involves frequency shifting a crystal, and you can't use it with a synthesized rig. Kantronics is selling a digital radio specifically for this use. It has two crystal channels, runs two watts, and sells for about $200. It's the DVR2-2.

Then you need a TNC that will support a 9600 baud modem, and I think that means (at the moment) the Kantronics Data Engine. They're a little pricey for me.

>   Finally, if I'm interested in TCP/IP and require KISS mode,
>are'nt most TNC's overkill since it seems like KISS is almost a
>straight connection to the modem.

Well KISS isn't exactly a direct connection to the modem. The TNC CPU is still used to frame packets, check DCD, and a two-way data buffer. The only difference is the ROM, so the hardware isn't any cheaper.

>   Which brings up the final question. With today's PC's getting

>software on the PC and drive the modem directly. Certainly my SE/30
>is fast enough to do even 9600 baud. Does this exist or am I just
>dreaming?

Frankly it doesn't make sense at all.

Back in 1980, I converted my TRS-80 model 1 into a dedicated packet terminal. It drove a Western Digital SDLC packet controller chip, and I adapted software written by the Vancouver Amateur Digital Communications Group to run on the TRS-80's Z-80. This is essentially what's going on now with the TCP/IP software.

The problem is that you give up doing anything else with your computer.

Typically I use Procomm to speak to my TNC. With Procomm I can run a split screen CHAT mode, I can capture data to disk, I can read a string of bulletins then scroll back and read them at leisure. Other packet terminal programs have been written to capture different data streams or connections to different screens. When you dedicate the computer to doing packet I/O, you really give up all that flexibility.

Sure you can write those features into TCP/IP programs, but that means that everyone has to do it *your* way. Instead of picking between several varieties of terminal programs, I only have the one available, unless I want to hack on the NET code myself. I can't add a widget to my computer that does something interesting to this nice data pipe that I've attached. There's nowhere to put it.

At my station I use the AEA PK-88. In some ways I regret buying this unit, because it won't support 9600 baud. But in most ways I'm tickled pink with it. The software ROM is rock solid (a couple of known bugs are well documented by other people). It has a very good maildrop with reverse

forwarding to full-service BBSes available. And I bought one off the shelf for $120 at Quement Electronics.

And to me, best of all, I can shut off the computer, or use it to do other things, and my TNC sits quietly under the radio sending my beacon, or getting messages from friends. This is the kind of multi-processing I really appreciate.

Let us know ...

Amen!!

I once got into an on-the-air voice argument with somebody who felt that way (the immediate context was either NET/ROM headers or binary file transfers, not TCP/IP, but the idea was the same). I replied that by the very same reasoning, a neighbor with RFI in his stereo could ask him to stay off the air, even if the fault were to lie completely with the stereo.

I explained that if several signals sharing the spectrum carry
"something" that distinguishes wanted information from unwanted
information and a receiver doesn't make use of it, then you can hardly
blame the transmitters for any problems that result. It doesn't matter
whether the "something" is a different frequency allocation or a
protocol ID, you can only fix the problem at the receiver!

He got *very* upset and refused to accept the analogy, mainly because
I think he knew that it was a very good one. But I never heard any more
complaints from him.

Just have her pick up a VHS camcorder and then an 8mm camcorder. Regardless
of technical merit, 8mm is a big plus in weight. In addition, the 8mm cameras
all seem to use those little tiny batteries available at Radio Shack for
$30, not the mucho-bucks of the big camcorder batteries.

You can get super VHS, or super-Beta camcorders, but 8mm gives as good
a picture as your likely to see with home recording, and the sound is
not linear on the tape. I bought a cheap 8mm and they do cost a lot
more than most VHS stuff, but just have her TRY one, and you won't
want anything else.

>you really give up all that flexibility.

But you don't have to dedicate the computer to it. Just have a process
doing what the PAD part of the TNC does. Give it a high enough priority

that it can't fall behind. You should still have the majority of CPU
time available for the terminal program, and whatever else your computer
does in its spare time.

In 1980 your TRS-80's cpu wasn't any faster than the CPU in a TNC, and
you couldn't get a multitasking OS to let you separate the packet assembly
program from the terminal program. A lot has changed in 10 years.

Having a standardized TNC does have advantages, like you never have to
worry about porting a new protocol to your platform, or losing the software
on your disk.

With the hardware that you have (a computer and the IC-24AT it is no
problem to go up to 2400 baud with just simple cables, a TNC, and a
terminal emulator. If you want to get started the cheapest way purchase
a 1200 baud TNC (such as a MFJ 1270B) and plug this into one of you
computer serial ports, plug in the radio, run your software and off you go!

|>

|> available?
2400 Baud modems are available from a number of vendors. The only real
problem is that they are new and most people have not purchased the
upgrade for the old modems. I will have one on Dec. 25th hee hee :-}.
A 2400 baud modem can still be plugged right into the radio with no
problems. I am sure that the computer will have no problems with this
(most computers can handle 9600 and some can handle 19200.

As for 9600 baud... Some kits are available now, but they are dedicated
units and most people who use these are using them with the satellites
(I think).

If you have big $$$ and can wait awhile longer then you can get one of
the new generation modems from AEA or LL Grace. These modems are DSP
based machines that will run all modes (including 9600 baud packet).
The cost for these is around $700!

|>
|> Finally, if I'm interested in TCP/IP and require KISS mode,

As with everything nothing comes for free. The modem companies want to
sell to the largest number of people possible, so they include software
for both types!

|>
|> Which brings up the final question. With today's PC's getting

This has been done for the IBM/PC compatible. From a company called
DRSI. The cost of these products is not cheaper however than the
external modems.

As for using your using your SE/30... Don't count on it... Most hams own
IBM clone computers since they are alot cheaper than a Mac. You can
use your SE/30, but you may find that the software is harder to find....

Good luck!

>all seem to use those little tiny batteries available at Radio Shack for
>$30, not the mucho-bucks of the big camcorder batteries.

Picking a camcorder isn't as easy as choosing the lightest unit. There are
many tradeoffs and due to the significance of the investment it is worthwhile
to do some investigation. The 8mm units are small and light but overpriced
due to the manufacturer's monopoly on the format. Their tapes cannot be
played back in the home vcr. They use nicad batteries that have very limited
capacity, easily develop memory, and self-discharge rapidly (which means that
when you pick up the camera after not using it for a month the batteries are
half-dead and will expire just as junior blows out the candles). The cameras
are small and due to their design the weight must be borne completely by the
hand rather than resting on the shoulder as the larger units do. They
tend to bob around alot when handheld because of the way they are held.
The resulting movies are hard to watch. The larger VHS units are easier to
hold steady, especially for long periods. They cost much less than 8mm for
the same features. VHS Tape is much cheaper and plays directly in the
home vcr. The batteries are gelled lead-acid and don't develop memory or
self-discharge quickly. They are much cheaper (for a given capacity).
One inexpensive GE VHS camcorder I looked at recently would run for 3+ hours
on one battery. The 8mm units generally poop out in way under an hour.
The VHS batteries are generally available for around $40. The large
capacity batteries the 8mm units need to run even one hour cost closer
to $100 and stick way out the back of the camera and make it much heavier
than it was with the stock battery.

Still, the 8mm may be the best for her -- but some thorough

investigations are warranted.

>You can get super VHS, or super-Beta camcorders, but 8mm gives as good
>a picture as your likely to see with home recording, and the sound is
>not linear on the tape. I bought a cheap 8mm and they do cost a lot
>more than most VHS stuff, but just have her TRY one, and you won't
>want anything else.

If I remember correctly the original post was for info on a newsgroup that
might have more info on picking a camcorder, try rec.video.

perley@trub.crd.ge.com (Donald P Perley) writes:
>[I wrote:]
>>The problem is that you give up doing anything else with your computer.
>
>Why?

When I'm running NET or NOS right now, I have _no_ features that I get with
my existing terminal emulator. I can capture, but I don't have keyboard
macros, or scroll back, or script files, or chat mode, or ....

I've seen nothing here to suggest that this is going to change anytime in
the next couple of years. NOS-in-a-box is what's being proposed, _not_
a computer-resident process running a packet controller chip. In fact,
the sentiment I've been reading on tcp-group is urging Phil to avoid
re-writing Unix and build something for realistic small hobby PC clones.

>But you don't have to dedicate the computer to it. Just have a process
>doing what the PAD part of the TNC does. [...]

Pardon me? My 286 doesn't do that. 1 Meg of memory is barely room to run NOS. I don't have $2500 to buy System V from Microport (that was the "special offer" price in a flier I just received). My 40 megs of disk are full right now with DOS tools, and I have no where to put UNIX. OS/2 isn't real on a 286, and Windows 3.0 might be a route to go, but it needs lots more memory and disk before I can do it on my 286 realistically.

Seriously, what are you suggesting is the best route for a typical small hobby computer owner? My TNC cost me $120. A computer suitable for serious multi-processing will cost me $3,000.

X-Reader: NETNEWS/PC Version 2.1

Some friends of mine have sent me the following letter but unfortunately as my hardware expertise is oriented towards 8051/6809 uP, I can't help them but you might ...

"...Digicom and its variations runs on a C64 (nearly 39k) and we would like it to run on a Commodore Business Machines 4032 (40 column, 32K), a 8032 (80 column, 32K), an 8096 (80 column, 96K) or a PET with 32K.

There are literally dozens of these machines about and they would be ideal for Packet if Digicom can be made to run on them. They all use the 6502 CPU and comparable VIAs etc and run on a similar manner.

My information reveals that the different use of the Kernal entry points is the major factor. Also the limit of 32K of memory may be a problem in the later versions of Digicom but may not be a problem in earlier versions

73s Ian ZL1BKZ"

So how about it - seems like it would be possible (from one who avoids
C64s like the plague :-)

Seems a pity to waste all that hardware ...

Any help would be much appreciated.

Thanks
Giovanni ZL2BOI

>slow if every packet has to be intercepted by the station
>operator for a "bad word check".

This is only important if there is IP-level connectivity between an amateur
radio and non-amateur-radio station. If two amateur stations are going at it,
the sender is by definition responsible for the content of his transmissions.

The rule is that the person who first introduces the traffic onto the amateur
packet network is responsible for the content. This is the originator if it
is a direct ham station, or the operator of the gateway if the traffic is
from elsewhere.

In theory, this is quite possible. In practice, I haven't talked to anyone
who has gone mobile with the DSY modems...

>location $C2FD in the EPROM.

I have had similar problems with my KAM's rom, version 3.0   The low tech
solution to the problem was to set the PTEXT (The personalized message
on your PBBS) to [KAM-3.00-H$] which took care of the problem.

I spoke to Kantronics and they said that older versions of the MYSYS and RLI
BBS's didn't need the $, thefore the EPROM wasn't burned that way.

Dale did the original experiments with the modems mobile. He sent digital
voice, not packet, from base to car in motion. It degraded very gracefully
under severe multipath. We have one user here who runs a portable mailbox
in his car all the time, but that's at 1200 baud.

Some answers:

1. The COMBIOS interface is an extension to INT 14 for COM ports.
Jeff, WA7MBL, started it but other add-ons were done by myself. G8BPQ
supports the full range and a few others. The added functions are

things like send-break, send-block, receive-block. See the INT14.DOC
file that comes with the code.

2. G8BPQ has no external multitasking ability. It is Terminate-
and-Stay-Resident (TSR) program. You run whatever you like on top.

3. I am not sure on throughput. I advocate the use of DRSI cards
since a dropped character is caught by the CRC and KISS mode has
no such safeguard.

The AA4RE BBS program runs just fine on top of the G8BPQ switch.

>One of the local clubs asked me about the G8BPQ switch software, and I
>don't know the answers:
>
>1. What is the COMBIOS interface referred to in the documentation, and
>how is it used?

It's a TSR which replaces the INT14 comm port handler in the BIOS, and
provides various extended services. Other variations on this theme
include MBBIOS and DVIOCOM. The G8BPQ code is an enhanced COMBIOS
interface which provides TNC emulation, NET/ROM compatibility, etc.
They all grab the hardware ports, and provide services via INT14 calls.

>2. Can G8BPQ be used as a multi-tasking executive for simple programs?
>(presumably that don't do screen access - like a C program that only
>uses stdio.)

Yes and no. You can run multiple programs that use the COMBIOS interface
on top of G8BPQ, but you need DESQview or equivalent to do the actual
multitasking.

>3. What kind of throughput can you expect on various types of
>machines?

That's a toughie... I haven't seen much hard performance data, but maybe some others who are using BPQ in multiport switches will chime in. I'm running it as a BBS access system with 2 2400 bps and one 9600 bps async ports, along with NET and other stuff under DV, but that's on a 16 MHz 386 machine. My guess is that BPQ would be hard-pressed to handle the situation you describe on an XT, even without a 56 kbs port.

>In particular, the proposed configuration is to run a 10MHz XT with 4
>or 5 radio channels attached to it. Two would be 9600 bps, one 4800,
>one 1200 bps. Probably KISS TNCs will be used, but maybe DRSI PCPA
>boards. There's some real concern that the XT might not have the
>horsepower to handle three medium-speed ports and one low-speed.
>
>What if we added the fifth port with 56kb?

As I said above, this concern is well-founded. My advice would be to run NOS instead of BPQ - then the box will be a thinly-disguised IP switch :-) I'm running NOS on an 8 MHz XT with two 9600 bps async ports and one DMA'ed 56 kbs sync port, and it works fine. If more horsepower is needed, 12 MHz AT motherboards are only $100 or so these days.

Hello all packeteers. . .

I don't have a license for radio, but have studied for one in 1988. Never did go thru with it. Now I'm here in OZ and have a few computers laying around (Kaypros) and was thinking it would be nice to piece together something like a packet station. I have the software for the old Xerox 820 type station, (W0RLI ???) and was wondering about its limitations & what it can do. I know I need a Radio & a TNC, but are there other hidden costs? How much time does it take to keep a station up? (My lifetime?)

Any repliers welcome. . .

Ronn

Sounds to me like you are set to go. You might want to investigate the
cost of putting up an antenna. Coax cable and the actual antenna might
cost you some money, but maybe you can find a real bargain for this
stuff. In case you didnt know, TNC's are designed to have a terminal
connected to them. If you have a term program, that is all you need
to command the tnc and chat with your freinds. Today you can even
get TNC's with mini-bbs's built into them.   If you can't get a terminal
program for your Kaypro, write one. You can command a TNC with
a very small program. I don't have any knowledge of the RLI software
you have.

Another thing is that there is alot of traffic
on the channels these days. You might want a printer to keep a record
of important messages and bulletins.

>How much time does it take to keep a station up? (My lifetime?)

If you run a TNC with a built in mailbox, you dont have to do anything.
Just fire it up and let it sit there. When you want to send a message
or read your mail, turn on your computer and see what is in the TNC with
your term program. You can then turn off your computer when it is done.

Have fun,

Jeff

Does anyone know yet if the Kantronics Data Engine Developers Reference is
available yet.

I know I could call them, but I don't want to do it too regularly as it is
not an 800 number (if you know one, that would be nice, too).

When I did talk to them, they did not tell me when it would be available,
nor would say they could tell me when it would be.

In fact, they suggested I order one through a dealer so it would be on back
order. No thanks, the dealers don't need a cash loan from me.

For what I want the DE for, the developers reference would be THE
documentation, and I always get the documentation for what I buy.

The WA4DSY 56 kbs modem has been available for about three years, and yet only a small number of them seem to be actually in use. One thing that has held it back is that it is not a "plug 'n play" solution - you have to build it up from a kit, and also provide external up- and down-converters between 28 MHz and the band(s) you want to use. This is really not very difficult, but there is another stumbling block: there has been no suitable hardware available for interfacing the modem to a PC/XT/AT. Most DSY users have hacked up a TNC-2 and installed a special version of KISS which allows the HDLC port to talk to the modem at 56 kbs, but the best the RS-232 port can do is 19.2 kbps (and some have even found it necessary to drop down to 9600 bps), so the capabilities of the modem are wasted. The DRSI card has also been used with the modem, in which case you can actually run at the full 56 kbs, but only by disabling interrupts and using programmed I/O to handle the 56 kbs packets. This means you can't service any other ports at the same time, which is not too useful for most situations.

Now there's a better solution available. The members of the Packet Working Group of the Ottawa Amateur Radio Club have been enthusiastic proponents of the DSY modem since we first put some on the air back in 1988. In January of this year, we installed the first 56 kbs full-duplex repeater. As part of our group's ongoing commitment to promote the use of this modem in packet networking, we have developed an I/O board which overcomes the bottleneck mentioned above. Dubbed the PI board, it uses the standard ISA bus interface and DMA to provide full 56 kbs throughput, while still allowing other low- and medium-speed async ports to function without dropping characters. Used with NOS, this board has achieved FTP transfer rates of up to 5600 bytes/s over a 56 kbs half-duplex RF link. The board also includes a non-DMA low-speed port. A working prototype was demonstrated at the recent Computer Networking Conference in London.

Lest I anger the net-gods, I hasten to add that the OARC is a non-profit organization, and that any proceeds from the sale of boards will be applied to improving the Amateur packet network. Nevertheless, this is all the sales pitch I plan to do via the Internet mailing lists. If you would like further details on the PI board and how to get it, please send *mail* to me:

hi out there,

recently someone asked for games implemented on packet radio. sri, i lost the originator's email address.
dd4os, boris, has written something for the dec rainbow as a game server a few years ago. maybe it works on ms-dos in general. i cannot really remember, what the game was like, it was something like a lunar landing simulation.
due to our links here in germany it was incredibly slow when used via digipeaters, but it worked well on point-to-point links.

if you like to contact him: boris is working at the ai-labs of the university of hamburg, frg.
his email address is pasternak@informatik.uni-hamburg.dbp.de

if you cannot get through, send mail to me, i will forward it to him.

good luck,   bernd

Greetings! I need source code to be able to use NOS on a PC and have telephone access to it using QMODEM/PROCOMM/ETC. Also I am running Ethernet to a Novell File Server as well as to Internet. I want to be WA1QWA.AMPR.ORG to my KISS link and PORTCOMM.WHOI.EDU to my ethernet. Can the mailer be set up for this? I define each hostname before attaching but I still have last defined problems.
      Tom Clark in his DV setup initializes his ethernet card inside the DV window, but I would like to already be linked my Novell File Server before starting DV. Any suggestions would be appreciated!

Subject: REQUEST FOR INFORMATION ON LAB TEST EQUIPMENT

I've been given some partially working lab test equipment that I would
like to use around the bench at home, but have no manuals which would
help a great deal in repair.

If you have manuals for one or more of these pieces of equipment, I'd
be more than happy to either pay for the copying at your location or
for the shipping to get them to here for copy and back to you.

Here is the list:

O'scope, Tektronix model 564B storage scope
     with : 3A1 Dual Trace Amp Plug In
               3B3 Time Base
               3A7 Differential Comparator

O'scope, Hewlett-Packard model HP180D
     with : 1805A 100 Mhz Dual Channel Vertical Amp
               1824A Time base and Sweep Expander

EiP Autohet Counter, Model 351C
     (has panel markings to go to 18 GHz, but someone has robbed
      the first mixer and also the basic counter board, which can
      probably be rebuilt)

Universal Counter, Hewlett-Packard HP5328A with Digital Voltmeter
     and "Universal Module" (what a great name!)

Mail, email, phone or fax reply would be appreciated. I'd like to
get the stuff working again for ham radio use. Thanks.

My only problem is getting up to speed with radio, affording a rig, and worrying about a license. What is the situation with packet licences? I heard that shortly after I left the US there had been a new class allowed for digital and computer types which didn't require Morse code. Is this correct, and how about Australia?

> Another thing is that there is alot of traffic
> on the channels these days. You might want a printer to keep a record

I'm not sure if the traffic density in Adelaide is anywhere near that of CAL or parts of the US. I'm sure it's a magnitude lower considering population density alone! That's why I would like to get this going. Phone costs here are phenominal to get to your favorite BBS which happens to be on the other side of the island!

Is it possible to act as a hub for other users? Sorry if that's a dumb question. I'd like to have one of my computers doing that kind of thing while I use the others for cheap networking. I Want to get around the "public" utilities here; namely the phone company.

I posted this once before but didn't get any reply...so I'll try again:

Does anyone know the modulation scheme used in the Kantronics, DRSI and
MFJ 2400 baud packet modems? Are these something like Bell 201, v.26,
or other QPSK scheme... or are they some agreed apon proprietary method.
I heard rumors of 1600 Hz carrier which would make it much different
than Bell 201 or v.26.

Any ideas?

Thanks. Chris N0JCF

I just bought a YAESU FT-212RH 2m radio and a AEA PK232 multi-mode
controller to build my
packet station around. The YAESU manual says to "open" a solder bridge
on the main circuit
board to remove the "tone burst" function. Has anyone already made this
change and been
successful with the PK232 ? Will I be missing something if I can't do
the "tone burst" ???

Thanks,

Lee Stogner

I alway's thought that playing games real-time or else
batch style mode would be fun. Would anyone out there
be interested in playing Stellar Conquest ? I think
it would be fun, but a move might take a long time, like
maybe two weeks. How about chess, or checkers ?

Jeff

Hi Bob
A compnay known as Digital Radi systems (DRSI) makes a half length
card that comes in three types. All have various options and go
for between $90.00 to $150.00, these prices are discounted by the
various mail order houses. Where I live,in the New York Metropolitan

area, These boards are very popular with the packet cluster operators.
They are advertised in magazines like QST, 73 and CQ. Hope this
helped you. If you are on packet at all my home station is WB2IBO-4.
This is a packet BBS on Long Island New York.
Gud Lk and CUL 73 Bob McLaughlin, N2IHL.

Part of it is historical, viz., in the early post-WW2 days precision frequency
control and stability in the microwave region were unknown. Big, big bands were
allocated in the sometimes forlorn hope that with that big a target, we'd
manage to land somewhere inside of it.

> Will I be missing something if I can't do the "tone burst" ???

Lee, I didn't implement this mod. I just acquired a 212 for use with
packet, and since tone burst is used in Europe when bringing up repeaters,
(here we may use PL), I fingured it really didn't matter. I believe if you
read further, you'll see this only works with a specific mic, which
is not the one you have.

I forget the second mod, one removed a jumper, one installed another. But,
I figured I didn't need that either.

Everything works fine, of course, but I do have a little funny. I am interfaced
to a KAM KPC-II, and I have to toggle EQUILIZATION on and off to better
receive signals. It doesn't make sense to me. This is part of the new
3.0 firmware from AEA with the build in DCD routines. If anyone has any info
on this it would be appreciated.

73,
Gene (AA6IY @ N6LDL.CA)

> or other QPSK scheme... or are they some agreed apon proprietary method.
> I heard rumors of 1600 Hz carrier which would make it much different
> than Bell 201 or v.26.
>

The KPC-2400 is based on V26 `B'. This is QPSK with a difference. As you may know, QPSK is a two dimensional signal. Adjacent bits are modulated (multiplied onto) sin and cos of the same phase respectively. This means that during each BAUD time (symbol time) TWO bits are encoded. You are GUARANTEED a transition happens in at least one of the I and Q channels each and every baud time. How? The symbols are encoded by means of phase transitions. If the two dits you are about to send are 00 then you make a 45 degree phase change. The entire table looks like

00	+45 deg
01	+ 135 deg
11	+225 deg
10	+315 deg

This allows for an extremely simple decoding algorithm and one that doesn't even need carrier phase to be recovered to provide nearly `optimal'.

You do a complex differential decoder at this point and recover the phase CHANGE from one baud time to the next. That is, if you consider the low pass version of the complex signal generated by the standard ` multiply the signal in quadrature by your local carrier reference and then low pass filter' then detection of the phase change can be had by multplying the signal vector NOW by the complex conjugate of the signal one baud time ago. This represents a vector giving you the phase change from one baud time to the next. You do a simple algorithm which says `which quadrant is this vector in' and use the table above to decode into bits.

V26 (a and b constellatiosns) both use 1800Hz as their carrier. So far as I am able to tell, by looking both at the KPC-2400, and the AEA PK-90 with 2400 bps addon, they all use a standard chip set and almost all use the SAME chip set. People continue to forget that radio is NOT

a telephone line. These chip sets were designed for use in a place where
they were guaranteed by CCITT Fascicle VIII.1 - Rec. V.26 bis that
the carrier would be within 5 Hz of correct. Therefore there is no NEED
for a PLL to recover phase since the algorithm I have briefly describved
is what is implemented in this chip set. This is <THE> reason that
HF experiments with the V.26, V.29, etc. chips are ALL doomed to failure.
They all do this differential detection stuff since it provides near
optimal noise performance ON A TELEPHONE LINE. Frankly, I think this
is one of the WORST things Kantronics has done and the others has blindly
followed in an effort to keep up with the Jones. I can't wait for to
see how much better V26B performs in an `amateur radio oriented' implementation.

I thought it might be of general interest to many of you if I made the announcement of a new Conference - The Microwave and RF Forum. Accessable directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance

of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there
are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your

local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)

Dear net people....

Hopefully, someone can come to my rescue with problem/query.

I've been on VHF packet for a while now... using a Kenwood 731A,
PK232 and a Mac. All is well.

I decided to try some HF packet, RTTY, AMTOR and the like with my
TS-440S. The kenwood 731A and the 440S have identical Mic jack
connections. So, my already constructed mic<-->PK-232 cable should
work fine - right ?

For HF the PK-232 manual says to put the HF rig in LSB/SSB mode,
apply the tones to the Mic jack (as I do in the case of VHF/Packet),

enter CALibrate mode on the pk-232 and adjust the Mic-gain on the
HF rig for an on-scale ALC reading.

Simple enough. But, something appears very wrong in that I get a
very erratic reading on the ALC meter. I would assume that a
pure tone as is being generated by the pk-232 (mark or space) would
produce a stable ALC meter reading. I did all this through a dummy
load (of course) and also see that the power out (watts) is very
erratic - following the ALC meter reading.

If I had to guess it would seem that the pk-232 is over-driving the
Mic input to the point of distortion. But, there is no adjustment of
the AFSK output level that I make that gets rid of this erratic
ALC meter reading.

Again, the VHF packet works fine. I can monitor solid tones in
CALibrate mode. No problem with the drive level on the FM rig and
I would assume that I can use the same drive level for HF as I do
for VHF/FM packet (as this adjustment is critical for FM). That is,
get the pk-232 AFSK drive level set for FM/packet then use the Mic
gain control for when I switch to HF/SSB.

Whew. How can something so simple get so complicated.

Plenty of people out there must have TS-440S rigs (successfully) hooked
up to PK-232s.

So, whats the story on these erratic "warbling" ALC meter readings when
in PK-232 CALibrate mode ??? Not normal right ?

I know I should be using the ACC 2 jack on the Kenwood rig. And, I
am having a cable made according to the specs in the pk-232 appendix
for kenwood radios (so I hope their right about the connections).

In any case, the Mic input should work. And it will be just my (bad) luck
that when using the ACC 2 jack I get the same thing.

Anyone got an insight into these erratic ALC readings I'm seeing ?

Thanks
  Gary

Hello.
My name is Rob Mayfield, VK5ZEU South Australia.

We have started up a tcpip network here, and Im after some help ....

We have an existing AX25 net, running W0RLI bbs and AAR4E? bbs in the area.

Im not that familiar with the why's and wherefore's of our existing system so if this doesn't sound right, please understand. My work includes responsibility for a sizable ip network, hence my interest in improving and streamlinig things by implementing tcpip on packet ....

Our problem is that we (all 2 of us at this stage) need to source some form of BBS capable of accepting our ip mail via smtp and re route it on the ax25 net (soon to go ROSE i believe) as well as accepting any mail and bulletins addresses to us and routing them to our machines.
Can this be done with a BBS, and can we include a domain name server ?

I have been told that W0RLI can be set up to do at least part of this but our problem is that with only 2 of us here, there isnt a large amount of 'local' expertise to tap for these sort of questions (well .... none actually :-( )

I suppose at this point, the questions are straight forward.

1. Can we do this all from one cpu.
2. If not how many.
3. In area's where ip is more established, what s/w packages are preferred to perform these functions ?
4. How many of the above functions do these packages provide?
5. Where can I get hold of these on the Internet ? (is there an up-to-date Australian ftp site for this type of software?)

Im running Netmac, and a friend NOS on an IBM clone. I believe the mac version lags the IBM significantly, so if domain name serving is a function of the IBM NOS version, we just havent got that far yet .....

Any help would be greatly appreciated. Ive only been on packet for 3 months, but it seems to me that the locals here aren't really interested in the advantages of tcpip. (are they mad, or are we ??) They also dont seem to be terribly interested in supplying more than just an ax25 feed for us.

I may be barking up the wrong tree, but surely gateways exist for these purposes ?!?!?!

I'm posting this to a number of you that I have found in documentation on ka9q code, and other area's. I am interested in hearing opinions/suggestions from all addressee's, so we can make a (hopefully) wise decision based on a good cross section.
thanks in advance ....

73's .... Rob

>   Nick

I had problems with garbage being received using my 9600 baud
Pac-Comm modem (I beleive this is the G3RHU design). The RXD from
the modem is garbage until it is locked and the RXC line is also

not on frequency. This is going on when no signal is present.
My mheard was full of garbage after a little while both with
Pac-Comms PMS firmware for the tiny 2 and when using NOS (dont have
PMS revision number here at work).

The way I fixed this was to qualify the RXD from the modem with
the locked signal from the modem. There is a 74HC14 used to drive
these lines and I removed the socket for this part and loaded the
part directly into the PC board. I then piggy backed a 74HC00 on
top of the HC14. I do not have the mod here at work but I is
fairly straight forward. You want the UART to receive zeros until
locked is true. Once locked is true, you want the UART to clock
the RXD from the modem. I checked my mheard on the 9600 baud
TNC this morning and it had only one entry (the only other person
in the area using 9600 baud).   If you think this is what you are
seeing, you might want to make this change. If you would
like more detailed information, let me know and I will gather up
more information and reply to anyone who is interested.

While I am at it, I also made another modification to the modem.
I now pass the 12 volt signal to a LM317 adjusted for about 9 volts.
This 9 volt supply is used for the modem board.
If your power supply sags on transmit and you are modulating the
crystal directly, you might get some frequency shift when the transmitter
comes on. This is because the op amp which modulates the transmitter
is operating with a single supply. If the supply voltage drops,
the frequency might shift slightly and then recover after the
coupling capacitor charges. This will vary depending upon the
load that the modem is driving. Low Z loads probrably will not
see the problem as bad. I tried a smaller capacitor but the error
rate of the data was poorer. The regulator fixed the problem by
better regulation to the op-amps. The sag on my power supply was
very bad and the modem instructions did say that I should use a smaller
capacitor. I figured that regulating the +12 would be worth the
effort even though I am no longer using Radio Shack jumper clips
to connect the radio to the power supply.

Hello all,

I was wondering if anyone had any experience with Kantronics EQ
(equalization) command on the KPC-II TNC.

I receintly changed my packet station's rig from an Alinco to a
Yeasu FT-212RH and now find that that I need to set EQ ON if I wish to
connect to local hams, while I need EQ OFF to connect to my local BBS
(on the same freq). If I don't make this change, I almost never get a
connect.

Couple of hints: The BBS is running the Data Engine (my friends KPC-IIs).
          The KPC-II I am running is using 3.0 firmware and I am
             making use of the DCD code (i.e. running squelchless)
                 I think this problem showed up as I changed rigs.
          I did not modify the FT-212 for packet, as the mod only
             disables the tone burst function of one of their mics.

Oh well, if anyone has any ideas as to what I should look for, or what
other parameters could be tweaked, I'd appreciate it.

Tnx es 73,
Gene

This is a classic case of RF feedback. Use standard RF suppression techniques
such as RF chokes in the AF leads (toroids ok, put the suppression as close
as possible to the mic connector) and .001 caps to ground at the mic connector.
While you're at it, put suppression in the power lead to the TNC. Ground your
TNC to your station ground. Undo that fancy cable lacing and seperate your
cables.

This article is partially reprinted without permission from the Sept. 24,
1990 "Electronic Engineering Times":

--
Dayton, Ohio - NCR Corp. has joined a small club of vendors seeking to
sidestep the physical media debate in local area networks by proposing
that users switch to a wireless LAN. At the recent NetWorld conference in
Dallas, NCR introducted an interface card for "WaveLAN", a spread-spectrum
RF LAN that uses an omnidirectional radio antenna in conjunction with a
standard PC add-on card, providing LAN connectivity at 2Mbits/second.

  [technical stuff deleted, incl. why infrared LAN's don't work -ed]

NCR has solved the security problem, at least in part, by offering
encryption of LAN data using the Data Encryption Standard as an
optional feature for WaveLAN. The signal, spread between frequencies
of 902 and 928 MHz, provides additional security from interception.
NCR has applied for eight patents associated with the wireless LAN
technology. The IEEE 802 group of LAN committees has established a
special working group, P802.11, to analyze wireless LAN standards,
with which NCR is involved.

> phones, or use cellular, should realize that they are "transmitting".

Why? The average layman doesn't know beans about the technology of HOW those things work. The "expectation of privacy" concept of someone whose only knowlege of radio is that it's like TV only without pictures is totally different from a ham's or an engineer's. I once tried explaining to a friend that her baby monitor could be heard as much as 1/4 mile away. She refused to believe me ("because I've got the other half of the pair").

> IMHO if "their" transmissions are in "my" air then they are "mine".

Aside from the question of whether it's "your" air exclusively, there's the question of whether the information content ownership is a separate issue from the possession of the signal by which it is transmitted. So far, the courts have agreed that it is.

I think swls are going to have to get used to the idea that as radio use for such applications increases, the pressure to guarantee privacy is going to increase.

Moreover, there is the fundamental issue: why would any decent person WANT to eavesdrop on the private lives of others?

Considering that Congress created the FCC to act in its behalf, I'd say, YES.

There will no doubt be a contention that transmitting certain types of radio signals (such as baby monitors and cordless telephones) ENLARGES the personal space. I grant the right to determine if an RF signal entering my space harms me in some way. I doubt that that requires that I inspect the information contents of that RF signal.

> Think about it ... If monitoring cordless phones is illegal, then what

No, only the information.

> It should be noted that authoritarian regimes tend to place

> free-thought being picked up by the masses.   Laws against radio
> receivers
> are censorship, plain and simple.

Strange, but the U.S. is one of the very few places where people feel this way. In most other countries, including very democratic countries, the attitude is that the public only has the right to listen to radio transmissions that are the public's business. Listening to "private" radio transmissions is forbidden. ("That's rude, old boy!")

If you are speaking of 'phone patches, yes, it must originate there. If you mean can you send a MARSgram, the answer depends on whether the APO/FPO zip is on the approved list. This is not automatic for all APO/FPO numbers everywhere. It depends on whether there is a MARS station for that immediate area.

Recreation contacts (other than overseas morale 'phone patches) are never authorized.

Ok... I know there are probably those that will be upset that I am asking
for this (if this is like most other groups ;-))

Overview:

    I am under the impression that packet radio will allow the transmission
    of computer data over some distance through the "ether" without
    having a wired pathway (hence radio).

    It is also my impression that proper equiptment will allow the
    selective transmission of data between specific machines.

Let me fill in a few details and ask some questions.

I have a 80386 Box running ISC 386ix.

1) Can I use packet radio to retrieve netnews data ?

2) What equiptment would be needed to have a quality setup to start in this
   area without spending a LOT of money.

3) What are the costs (equiptment, govt. fee's etc.)

   Thankx!

Short of banning ANY type of general coverage receiver, I can't
see what outcome any pressure would have on the radio listener,
be that an swl or simply someone that has a radio. At this point,
there must be millions of very broad coverage receivers in the
hands of the public (Both regular types and scanners). Are we
to expect confiscation? Legislation limiting future receivers/scanners
manufactured from being able to receive certain frequency ranges
(that's done now with the cellular on scanners, but it's a
simple task to modify most of those scanners after ownereship.)?

At some point, if there is a call to restrict receiveing of a
multitude of frequency ranges and specific frequencies, it becomes
(IMHO) almost impossible to design a cheap scanner/receiver.
Note also, the use of the radio spectrum is not static. What
you find in a particular frequency range today may not be the same
10 years from now.

So what's it all mean? Again, IMHO, I really doubt that much
will happen in the area of prohibiting general coverage

receivers or significantly limiting multiple ranges of
frequency coverage. Having said that, it does remain incumbent on
all of us, hams AND swlers to remain vigilant and sound the
alarm immediately at even the first sign of any such global
restrictions in equipment design being instituted.

In article <291.271DE138@w8grt.fidonet.org> jim.grubs@w8grt.fidonet.org (Jim Grubs) writes:

>Moreover, there is the fundamental issue: why would any decent person WANT to
>eavesdrop on the private lives of others?

This is an excellent example of how asking the question will
influence the response. The fundamental issue is NOT whether
decent people want to snoop on others. Rather, its a division
in philosophy between freedom and privacy. On the one hand,
people are generally ignorant about the technology they use.

As I recall, many congressmen were stunned to find out that
anybody with a Radio Shack scanner could listen in on the
cellular conversations. That realization (plus a little
high power bribing -- no *campaign contributions* -- from
the cellular industry) led to the ECPA. On the other hand,
this country has (at least historically) prided itself
on its emphasis on individual freedom. Virtually
unenforcable laws like the ECPA are an attempt to restrict
one's freedom, something that most Americans still
value pretty highly. I like to pick up a copy of Orwell's
_1984_ and reread it every few years. Partly to enjoy it,
but partly to remind me to keep my guard up against
our benvolent government (grin). Freedom is hard to win
and easy to lose; one minor loss leads to another, which
leads to another, and so on.

I see that the 56Kbaud modem operates with 70KHz. That seems to be the
same as the 2400 baud rates at the land-line 3KHz. I also noticed that
with the land-line systems today, you can get 19.2KB over 3KHz voice-line.

Is it safe to assume that with the same type of technology applied that
you can get 440KBaud at 70KHz? I don't know that much about spectrum
and bandwidth, but the figures look correct. Anyone care to explain some of
this to me?

It seems to me that if someone broadcasts their private life, either by
voice (yelling) or by electronic means (PA system, radio waves) then they
have no right to complain when others "listen in".   It's rude to expect
others to turn a deaf ear to your excessively boisterous lifestyle, eh.

> contents of that RF signal.

Keep your personal space out of my personal space.

An enlargement of the person space would require first establishing the
concept that actual security of the radio transmission really exists.
It would be an invasion of my PHYSICAL personal space for you to determine
if I actually am listening in (and ONLY doing that). Such security does
not exist for signals transmitted in conventional emission modes and not
encrypted. Maybe we need more DES baby monitors.

> No, only the information.

Suppose you toss a sealed envelope into my front yard, which contains
pictures of you and your SO making love. Is that an enlargement of YOUR
personal space? Am *I* violating YOUR space by making an EFFORT (opening
the envelope) to get the information.

I contend that tossing the sealed envelope which has information in it is
no different that tossing out electromagnetic waves that have information
in them. If you toss them MY way, I am CAPABLE of opening either, and you
have effectively given up your right to privacy.

You COULD have setup a wire-based baby monitor. In fact the intercom
system in the house I grew up in had a way for the master unit to listen
in on anything going on near the slave unit. You don't NEED to transmit
over the radio but you simply CHOOSE to.

Also, it is nearly impossible to be able to detect the signal without also
detecting the information. Of course that is decreasing with technology.

> transmissions is forbidden. ("That's rude, old boy!")

Strange, but the U.S. is one of the very few places where people felt this
way enough to revolt against an authoritarian regime and establish the
greatest democracy the world has ever seen.

Strange, but the U.S. is one of the very few places where we have a diverse

set of constitutional freedoms based on the concept that the government has
no more authority over people than the people themselves do.

Strange, but the U.S. is one of the very few places were have a reasonable
expectation of privacy of the things we do in our own personal space.

One of the US ATV manufacturers (AEA?) has announced a VSB 440 MHz
ATV transmitter that will help things out somewhat. It's going to
take a long time for the existing DSB transmitters to go away, though.

I like the idea of putting the ATV output where CATV televisions can
receive the transmissions, since it can provide an excellent PR tool.
(Imagine running weekly licensing classes over ATV on a CATV
compatible frequency. Publish the info in the local newspaper and
see what happens.)

I remember hearing that someone was using the blanking bar between TV frames
to transmit data. In the OLD days, they needed 36 lines at the end of
each frame for internal synchronization, but now it only takes 12, so some
bright guy got the idea that you could send data over that time at about
1200 baud. It worked great until both the TV station and the cable company
tried to do it at the same time, and then the lawyers got rich. I
haven't heard anything since.

>broadcasts must be directly human intelligible?
>--
>"This Bud's for you!" -- Budweiser Beer (example of a short commercial)

Such a thing has actually BEEN DONE!. A group of MIT students have put
together a system that uses SCA at 4800 baud (no commercials) on a Boston
Public Radio (as in National Public Radio") station. A description of the
system and an analysis of the results appeared in CACM (Communications of
the Association for Computing Machinery for the unaware) late this past summer.
Sorry, I don't have the exact reference with me.

In their system, one-way broadcasts of data (including, for a while, USENET)
were received by a home site, decoded and passed to a program running in the
user's PC/AT (the work was sponsored, in part, by IBM). A program in the AT
would use 'filter rules' on subject and content established by the user to
only save information of interest, sending the rest to the bit bucket.

The user could query the info and, if something in the query referred to
something not on the local hard disk, an autodial telephone modem would dial
up a mainframe at MIT which would then download the requested info.

Actually, it's already being done via satellite by Norsat in British
Columbia. They sell a complete downlink kit for $2K (2 foot dish,
receiver, PC demodulator card, software). The link runs at 9600
baud, and carries a complete usenet feed. They also distribute PD
software between news batches.

I am interested in the latest version of the ka9q package for the Amiga.
The last version I know of is the one on fish disk 225, which dates back
to 1987 and is quite buggy.

In this part of the world (So Cal), there are two ATV channels on
420-450. One is around 42x somewhere, and the other is around 433.5.
(visual carrier freq; the aural carrier is 4.5 MHz higher)

The 1.2GHz band has 5 ATV repeater output channels on it, all of which have
their inputs on one or the other of the two 420-450 channels.

If it suddenly occurs to you that you can't do that because the 433.5
channel isn't in a repeater subband, you're right. However, that's the
way the frequency coordinating committee assigned the channels.

Officially, I think, the 433.5 channel is simplex and not a repeater
input. But at least one of the ATV repeaters I can receive is listening
there.

At least most of local guys I can hear/see are running with a somewhat-
-suppressed lower sideband. I'm sorta amazed but well pleased.

The 433 video components play absolute Hob with trying to receive the
Microsats at 435 and 437. They don't seem to hit the DSY modems running
56kb at 433.05 much.

OK, I hope you read the summary line above. Here goes:

I've used networks, online services, and BBS's for years, but I've never
really paid much attention to packet radio. This may change... depending
on what kind of feedback I receive.

Basically, I'm starting from scratch, and need to have some idea of where to
begin. I have a list of rudimentary questions like:

1) Just what *is* packet radio?
2) What kind of equipment due I need, and how do I use it with my PC?
3) How much technical (hardware) proficiency is requied to manage a
   packet radio system? (I have a general understanding of computer
   hardware, but am more comfortable programming.)
4) Just what's out there for me to access via packet radio? (This is
   VERY important. I'm not interested in this as a pure hobby, I'm more
   interested in the resource potentials.)
5) How much will a packet radio set-up cost me? How COST EFFECTIVE is
   packet radio?
6) What legal issues do I need to consider regarding packet radio? Do I
   need a license?
etc.

Pointers to reading materials such as books and magazines that my campus or
local libraries might carry would be nice.

Personal comments and insights into the world of packet radio would also be
appreciated. I've tried reading the ham-radio newsgroups, but a *lot* of it
is Greek to me.

Any packet radio operators from central New York out there??

Thanks in advance,

-Tim

Hmmm... I'd like to pose a question: I've seen devices in the market
that allow for "wireless LAN". What if I just wanted to send IP packets
(or a TCP/IP link) across the street to a server (~600ft and some brick+
glass). Is this possible? If so, is it practical? What about the
highest transmission rates?

Does anyone have information on packet activity in St. Louis? In particular,
any NET/ROM or TCP/IP nodes?

73

In article <1990Sep20.073210.11479@oswego.Oswego.EDU> dayger@penelope.Oswego.EDU (Tim Dayger) writes:
>OK, I hope you read the summary line above. Here goes:
>
>I've used networks, online services, and BBS's for years, but I've never
>really paid much attention to packet radio. This may change... depending
>on what kind of feedback I receive.
>
>Basically, I'm starting from scratch, and need to have some idea of where to
>begin. I have a list of rudimentary questions like:
>
>1) Just what *is* packet radio?

Packet radio is a method of sending computer data over radio as the name suggests. Data is combined into blocks called frames that contain an address header and a checksum. The frames are transmitted in sequence with acknowledgements being returned for each sucessful frame received by the addressee. Timeouts without acknowledgement cause retransmission of outstanding blocks. A complete link level protocol that does this plus channel control is called AX25L2V2.

>2) What kind of equipment due I need, and how do I use it with my PC?

You need a PAD (Packet Assembler Disassembler) and a radio modem and a radio and antenna. The PAD and modem are usually combined in a unit called a TNC (Terminal Node Comtroller) which connects to your PC via a serial port. Another method uses a plugin card for the PC that combines a HDLC chip with a radio modem and uses software on the PC to do the PAD function. A third method combines the radio modem with the radio in a single unit and interfaces to the PC either via a plugin card or via a PAD that connects to the PC via a serial port. Depending on the system you choose, there are various software packages you can run as an application on the PC. There is BBS software, terminal emulation software, and TCP/IP networking software available. Most of it free.

>3) How much technical (hardware) proficiency is requied to manage a
>   packet radio system? (I have a general understanding of computer
>   hardware, but am more comfortable programming.)

In general most of this stuff is plug and play depending on how deeply involved you want to get in the technical details of packet radio. If you can solder a connector on a plug, you can hookup most packet equipment.

>4) Just what's out there for me to access via packet radio? (This is
>   VERY important. I'm not interested in this as a pure hobby, I'm more
>   interested in the resource potentials.)

Potential is the key word here. Other than sending Email via the BBS

network which operates sort of like fido net, and some file transfers with neighboring operators, and some databases you can query, packet remains a technique looking for an application. The potential is great and work is being done on both the hardware and software ends of the system, but it's not the internet yet.

>5) How much will a packet radio set-up cost me? How COST EFFECTIVE is
>   packet radio?

Starting from scratch, costs range from $300 to $700 for systems ranging in capability from 1200 to 56k baud. Cost effectiveness is a harder question. It depends on how much you use the system. The up front costs are it. There is no continuing charge other than electricity to use the system.

>6) What legal issues do I need to consider regarding packet radio? Do I
>   need a license?

Yes you need an amateur radio license to run packet. Well this is not strictly true, you could get a commercial license and establish your own point to point links, but unless you have a legitimate business need it wouldn't be cost effective. The other legal issues concern message content. Over any radio system you may not use profanity. And specifically over amateur radio you may not use the channel for commercial purposes nor may you use encryption to conceal the nature of your transmissions.

>Pointers to reading materials such as books and magazines that my campus or
>local libraries might carry would be nice.

Much of the material available in book form is outdated and describes systems and operating techniques that were in vogue two years ago but do not represent the way packet is done today. The field is in it's infantcy and is changing daily. The best way to learn about packet is from people who are actively using packet. The best techincal references are the ARRL Computer Networking Conference Proceedings volumes 1 thru 8. Also consult your library for back issues of the American Radio Relay League's magazines QST and QEX and back issues of the late lamented Ham Radio Magazine.

>Personal comments and insights into the world of packet radio would also be
>appreciated. I've tried reading the ham-radio newsgroups, but a *lot* of it
>is Greek to me.

I find the technical challenge of developing reliable high speed links and networking systems form the bulk of my interest in packet radio. In many ways we are charting virgin territory and that is always exciting. Others use packet primarily for personal Email. Still others use a database and bulletin system called Packet Cluster to aid their chase for DX contacts. People active in our volunteer emergency response system ARES use a hazardous materials database to retrieve on the scene information. ARES folks also use the BBS system to handle emergency messages for local officials and the Red Cross during earthquakes, fires, and severe weather. Locally, we have an active Skywarn group that works with the National Weather Service to report severe weather. We are integrating packet into

our operation. A great number of people simply use the system for keyboard to keyboard chatting.

Howdy:

Recently I place a call for help in getting development tools for the Harris RTX-2000. As I told you later, the response was great and I wish to thank one in particular. Tom Sefranek, WA1RHP, has made an indefinite loan of his RTXDS and development tools to AMSAT for the development of code for this engine. The RTX-2000 wil fly soon on RS-14 (RO-21 after launch) and on Phase III-D (the follow on to Oscar 13). AMSAT-NA, AMSAT-DL, and well all of us thank Tom for this kind loan.

Uh, Bob, what's an RTX-2000? I see the phrase "DSP" in your
keywords, so maybe it's a DSP microprocessor? If so, what will
it do on the satellites?

>The RTX-2000 wil fly soon on RS-14 (RO-21 after launch)

This is the first time I've seen a Soviet ham satellite called
anything other than "RS" when it's in orbit. Why will this one be
called "RO"? What does that stand for? And why "RO-21" when the
current transponders are RS-10/11? (I guess RS-12/13 is still waiting
in the wings?)

Patty

>
> I have no problems with 438-442, if it is used appropriately. I still think
> split freq is better.

What is a good alternative? The "usual" bandwidth is 6 Mhz when the
suggested vestigial sideband is used. You could trim things even tighter,
but no one makes anything to do that yet, and the best you could hope for
would be about 4.8 MHz. Suggest a place to fit that in.

> AEA is one of the culprits. From what I understand, the AEA unit will
> not work on a non-interefence basis below 442. (IE, it's output will
> still be in the FM band.) This is from a discussion with several hardcore
> ATV'ers at Dayton.

No, AEA is NOT the culprit, but rather the culprit is the bandplan which
puts the carrier at 439.25 MHz and that will generate signals all the way
up to nearly 444 MHz even if the filtering is working correctly.

> I asked how I could run an ATV rptr in my area, while coexisting with 443+
> fm rptrs. They named one unit that would work. It was not AEA. They liked
> AEA package & price, but indicated it did not filter as well as it should.
> This is their viewpoint. I would be interested in knowing more, as the AEA
> will prob be the most popular.

The AEA unit may or may not be filtering well, but even with a theoretically
perfect filter, you will be affecting more than half of one side of the FM
repeater subband.

> Actually, the ATV rptr output is usually the higher freq, due to not
> having the FM rptrs key it up. The ATV rptr will be the one needing the
> extra filtering. Is this correct?

Probably.

>
> Ok by me... ATV simplex seems like weak signal to me.. I do think we need
> to use the 420-440 area more.

Not everyone can use that. Remember that 420-430 is not available in all parts of the country. Try fitting just ONE ATV channel in 430-450 MHz that can be used for repeater operation. You do NOT want to put it on 432 MHz and you cannot put it on 435-438 MHz.

The 70cm band is currently very poorly fragmented.

This issue, while being certainly packet related since packet needs to definitely deal with coordination problems, should be moved over to the main rec.ham-radio group.

If a repeater coordinator "coordinates" for repeater use a frequency that is illegal for repeater use, that coordinator should IMMEDIATELY be put out of business. I won't be humble about that opinion.

> Officially, I think, the 433.5 channel is simplex and not a repeater
> input. But at least one of the ATV repeaters I can receive is listening
> there.

That repeater is operating ILLEGALLY....

> 97.205(b) A repeater may receive and transmit only on the 10 m
> and shorter wavelength frequency bands except the 28.0-29.5 MHz,
> 50.0-52.0 MHz, 144.0-144.5 MHz, 145.5-146.0 MHz, 220.0-220.5 MHz,
> 431.0-433.0 and 435.0-438.0 segments.

....unless he is keeping his input bandwidth between 433 and 435 MHz.

The purpose of restricting even the INPUT frequency from the segments
above is to prevent the USER of the repeater from causing intereference
on the designated segments, not just the repeater itself.

Before notifying the FCC, I would suggest contacting your section manager
and/or the official observer people regarding this. Brian, I know you know
about this; I'm just posting this for other reader's benefit.

> At least most of local guys I can hear/see are running with a somewhat-
> -suppressed lower sideband. I'm sorta amazed but well pleased.

But are the people who transmit INTO a repeater on 433.5 MHz doing this
with at least 40db at 433 MHz and at least 70db at 432 MHz? I just picked
those figures at random, but I think they would apply well to preventing
interference to 432 MHz weak signal work.

> The 433 video components play absolute Hob with trying to receive the
> Microsats at 435 and 437. They don't seem to hit the DSY modems running
> 56kb at 433.05 much.

The scrambling probably has a lot to do with that. Video tends to appear
in little spikes every 15734.265734 Hz plus or minus many Hz depending on the
frequency stability of the video source.

[15734.265734 Hz = (5 MHz) * 63 / 88 / 227.5]

As quoted from <1345@ke4zv.UUCP> by gary@ke4zv.UUCP (Gary Coffman):
+---------------
| In article <1990Sep20.073210.11479@oswego.Oswego.EDU> dayger@penelope.Oswego.EDU (Tim Dayger) writes:
| >4) Just what's out there for me to access via packet radio? (This is
| >   VERY important. I'm not interested in this as a pure hobby, I'm more
| >   interested in the resource potentials.)
|
| Potential is the key word here. Other than sending Email via the BBS
| network which operates sort of like fido net, and some file transfers
| with neighboring operators, and some databases you can query, packet
| remains a technique looking for an application. The potential is great
| and work is being done on both the hardware and software ends of the
| system, but it's not the internet yet.
+---------------

Much of "not on the internet yet" has to do with third-party traffic restrictions with respect to valid use in amateur radio, i.e. someone has to monitor what comes in from the Internet to make sure it doesn't contain business, profanity, or other illegal communications. The Usenet almost certainly wouldn't be safe as far as this is concerned. And would *you* want to spend all your time picking and choosing stuff that can legally be forwarded from Internet to AmPR.ORG?

The local ham club recently tried an experiment, using packet radio to link the endpoint and start of a local parade for which we were doing public-service communications. It worked well, and we're planning to expand the technique. One thing I'm planning on doing is getting a battery for my TNC and picking up a Kodak Diconix printer or other battery-operated printer; used with my HT and laptop, this would give me a complete packet system independent of mains power which could be used during an emergency.

+---------------
| >5) How much will a packet radio set-up cost me? How COST EFFECTIVE is
| >   packet radio?
|
| Starting from scratch, costs range from $300 to $700 for systems ranging
| in capability from 1200 to 56k baud. Cost effectiveness is a harder
| question. It depends on how much you use the system. The up front costs
| are it. There is no continuing charge other than electricity to use
| the system.
+---------------

A sample breakdown:

     $230.00 Kenwood TH-31BT (a discontinued model, hence cheap)
          This is a 220MHz radio, hence usable by Novice Class

licensees. Locally, we have packet on 223.70; other areas
may use 223.40 MHz. Both are within the Novice sub-band.
130.00 AEA PK-88 TNC (a good, inexpensive TNC)
30.00 Hustler 5/8-wave whip (better than the "rubber ducky" antenna
that comes with an HT)
0.00 Communications software; this can be a freeware/shareware
comm program, or anything up to NOSNET.EXE which gives you
TCP/IP. Or you can spend $50-$100 on commercial programs
which make controlling a TNC easier for a "novice".
0.00 A computer; if you already own one, you're all set. If you
get serious about packet, you may want to dedicate a computer
or run OS/2 or UNIX. I've dedicated a 386 PC to my setup;
it was sitting in a closet, unused. If you decide to buy one
specifically for packet, on the other hand, this will be the
most expensive part of the system!

$390.00 Total for my packet set-up

I will be erecting a better antenna soon; this will be relatively inexpensive, as I will be fabricating an antenna mast from either aluminum or PVC (I prefer aluminum, I can make it the antenna ground *and* the system ground by burying it deep enough) and the antenna itself will be made from an SO-239 and some brass rods. This will let me get the most from the 1 watt out of the inexpensive radio. I may also pick up a preamp/power amp combination for 220.

+---------------
| >6) What legal issues do I need to consider regarding packet radio? Do I
| >   need a license?
|
| Yes you need an amateur radio license to run packet. Well this is not strictly
| true, you could get a commercial license and establish your own point to
| point links, but unless you have a legitimate business need it wouldn't
| be cost effective. The other legal issues concern message content. Over
+---------------

You might be able to run a low-power, limited-range packet system on Part 15 frequencies, like 49 MHz. CHECK FIRST!!! I don't know if data communications are permitted (although it would surprise me if they weren't).

I doubt that data communications are permitted in the Citizen's Band. But it might qualify as Class C (the remote control frequencies, as opposed to the voice channels). Again, check before setting up shop here.

You can (see above) run packet with a Novice Class amateur license. This is *simple* radio theory, Novice band plans (not difficult to memorize, as Novices don't get much in the way of frequencies), and the inevitable 5WPM code test. Check with local ham clubs; they'll be happy to help you.

A few years ago the Stargate project set up and operated for one year a test system for the distribution of USENET in the vertical blanking interval of the cable version of WTBS Atlanta (the bits were injected into WTBS' signal in the satellite uplink, so the feed was not available if you got WTBS via normal UHF reception). There was a 16-bit field in, I think, Line 21 of the VBI, which gave a raw throughput of about 500 bits per second. 500 bits per second around the clock gives you about 5 megabytes per day of raw capacity.

Because there is no possibility of NAK/retry with a satellite link, every packet of data was sent twice. If you missed both of them, then you didn't get the data, and you just had to suffer.

There were seven subscribers. One of them was decwrl, and I was at the time decwrl's usenet administrator, so I had lots of first-hand experience with it.

The project was a failure for these reasons:

1) The downlink hardware was not reliable. It was manufactured for them by Zenith and the box was pretty shoddy. We have lots of world-class electronics and video experts in our lab, and we had a very hard time getting it working and keeping it working.

2) Because the satellite links were tariffed by the US FCC as "common carriers", they were legally permitted to carry only moderated newsgroups. There wasn't enough interesting material in moderated newsgroups back then to keep anybody's attention.

3) The satellite bandwidth was expensive. Satellites attract Big Business, and they weren't about to sell this service cheap.

We paid about $1000/year for airtime fees and such.

4) Although 500 bits per second is enough to get a lot of netnews through, it was awful with respect to latency. We got articles a fairly long time after they were posted. decwrl had a few other feeds, all by uucp/telephone, and never once during the entire year that the service was operating did we get our first copy of an article over the satellite feed. High-speed links are a lot like high-speed copiers: you want speed to have low delays rather than to have high volumes.

5) The feed was read-only. Everybody needed to have ordinary land-line access to USENET so that they could post replies to articles that they had seen. The combination of (5) and (4) was the death of the project, actually: the Telebit Trailblazer was just becoming popular at that time, and since people were forced to have an ordinary USENET feed as well as a satellite feed, so they could post, people quickly did the arithmetic and figured out that it would be cheaper, easier, and faster to take the whole feed via the TrailBlazer rather than to take part of it over the satellite link and part of it over the phone.

I have two Stargate decodeer boxes sitting in my office as museum pieces. I probably ought to mail them back to the Stargate people but I don't quite know where they vanished to.

As the originator of the Stargate Experiment, I'd like to add a bit to elaborate on what Brian said in his posting.

First, it's important to realize that the project *was* an

experiment. It was unclear going in whether the technology was really suitable for this sort of application, and we purposely limited the number of subscribers (we turned away quite a few potential subscribers). Since it was all very new technology, there was no way to determine how well things would work without actually having receive points in a variety of locations in different situations, which is what we did.

The Zenith decoding hardware had lots of problems. We unfortunately had no choice, since we had to use that hardware to make use of the WTBS vertical interval, and there were no other choices available to us at that time. We did not have any indications before the experiment that the equipment was so flakey--the information we were able to get led us to believe that they'd perform OK. Experience taught us otherwise. If we'd known in advance how bad they were we probably would not have proceeded. We never had direct control over the decoders--they were addressed and controlled from the uplink point, and we had to go through other persons to get anything enabled or addressed.

One thing we learned is that the quality of the decoder is critical given the highly variable nature of the received video signal after being passed through satellite and cable hops. The latter is particularly important, since cable systems can do awful things to a signal. Of course, over-the-air systems are vulnerable to all sorts of problems as well. All of this means that a large burden is placed on the decoding equipment, and in some situations with some signals *no* decoding equipment can be expected to work satisfactorily.

Anyway, we did the best we could with them. Sometime after the project closed, I ran into some other people who had experience with the same decoders. Their experience was identical to ours.

So, we were all generally unhappy with the hardware. That was one reason not to continue the experiment. Another reason was that the uplink carrier we were using was bought out by another entity, which caused a decision to be made to remove "outside" services such as us from their vertical interval. We, as "little guys", were in no position to fight this or wave enough dollars at it to cause a reversal. To move to another carrier, even assuming we could have found one that we could afford based on the subscriber fees at that point, would have entailed uplink relocation and a complete change of uplink and decoding hardware. As Brian mentioned, the satellite carriers are looking for people with big bucks when it comes to selling time on their satellite transponders.

All in all, it just didn't make sense to continue, since there wasn't other hardware around that seemed likely to perform any better anyway.

While the other factors definitely impacted our decision, the loss of the uplink carrier which was the immediate reason why the decision was made to terminate--there just wasn't a lot of point in continuing, and there didn't seem to be any real interest on the part

of the subscribers to go through the hassles that would be involved in new hardware, etc. in any case.

It is worth noting that nobody working on the project made a dime from the effort. All subscriber fees went to pay for direct project expenses. We ended up with a zero balance, and arranged to have the carrier pull the plug as the money ran out. All in all, not a bad way to end an experiment.

And indeed, just because an experiment ends doesn't mean it wasn't worthwhile. I would not call the experiment a failure. To learn that a particular technology is not suitable for netnews is meaningful information. While it would have been interesting if the results had been "positive", negative outcomes are useful too.

Brian's point about latency is quite significant. Given the structure of netnews flow today, it is quite possible that a "centralized" broadcast topology as represented by Stargate would not now be desirable for netnews distribution, even if a robust technology were used. Part of the problem is that netnews flow is not naturally unidirectional. The feed topologies have become increasingly bidirectional, with logical network splits (such as the "alt" distribution) further complicating the feed situation.

In the current network environment, the existence of high-speed (e.g. Trailblazer) modem links have become very important. Also of obvious importance, in my opinion, is the presence of the NNTP links which have effectively "absorbed" the backbone function of the netnews network. While the longterm stability of NNTP usage, and various issues concerning the propriety of certain classes of material flowing over certain elements of the backbone or certain local nets must be considered, the importance of the NNTP feeds in the current environment is obvious. I doubt that any centralized "broadcast" system can effectively compete (in terms of overall latency reduction) given the current structure of article flow.

Stargate was an interesting experiment. I'll never forget the fun of the initial transmission when I sent "Hello Universe" (yes, that's what I sent) over the satellite and watched it come through on my screen. Whether I should have attached any special significance to the fact that this initial transmission took place while "The Munsters" was on the main channel video is something I've never been able to fully determine.

Does anyone know of an archiver which is as portable as ZOO which has better
compression? I use ZOO on MS-DOS, on the Amiga, and a pile o' UNIX platforms
of many architectures, (none of which are 8*86 based, thank god). The source
to ZOO is freely available, and of reasonable good quality. Thats why I use
it. If there's a better alternative, I'd like to hear about it.

I recently acquired a TNC made by GLB Electronics in Buffalo, NY.
It is their model PK1. I purchased it thinking it was a TNC2 clone,
but I believe I was mistaken. It _does_ have a Z-80 (or equivalent).
But rather than a USART, it appears to perform this function in
software. [This is a real b*tch to accomplish, by the way, having
been down this path for a client who was more frugal than smart.]

Anyway, I assume that the TNC2 uses a real USART and what I have bears
no resemblance to a TNC2. So, has anyone done a KISS PROM for this
beast, or am I left with a dodo?

GLB's TNC2A is a TNC2 clone. The PK1 and PK1-L are not. In fact, the PK1 was commercially available before the TNC1 was. At least that is what they tell me (I was in high school at the time 8-).

Tell me about it! You are correct. Everything in that box is done by toggling the bits by hand. It was designed back when the correct hardware would have added another $60 to the price tag.

> Anyway, I assume that the TNC2 uses a real USART and what I have bears
> no resemblance to a TNC2. So, has anyone done a KISS PROM for this

I'm hacking on one now. The hardest part is coordinating the rs-232 bit streams and the modem bit streams. The start bit on the rs-232 goes right to the interrupt line. So if I'm in the middle of sending a packet and the PC sends a character, I either screw up the packet or lose the character. The way this is being fixed is by requiring the PC to use hardware flow control. That way I can tell it to stop sending and hope that it doesn't. Note that this goes against the official KISS specs but should not be a problem. The only other solution is to constantly poll all inputs multiple times per bit interval but I don't have the time (or ambition) to implement something that precise.

Anyway, the ROM should be done in 1-2 months. I'll be making the source and ROM image available via anonymous ftp then. Watch here for a release announcement.

Was wondering if anyone in net-land could help me with this.

I have packet station consisting of a MacSE, AEA PK232 and a Kenwood 731A. I'm trying to get the ka9q TCP package to work. The software starts up fine on the Mac - no problem. But, I'm unable to make any connections. Specifically, my first attempt, as a test, was to try to get the AX.25 protocol to work to connect up to my local Net/ROM node - CAPRA (Chicago Area Packet Radio Assoc.)

The ka9q software will not key the transmitting and I'm stuck in a "connection pending" condition. I have some thoughts on this and think the problem is that I have not entered KISS mode on the PK232 with the correct parameters.

As far as "nornal" packet operation is concerned... evertthing works fine

so I know I have the connections (cables) set up properly.

I have PK232 firmware dated 19.Jul.90. The Tech manual gives a set of instructions for what paramters need to be set before going KISS. The 19.Jul.90 firmware revision says all I need to do is say "KISS ON" and warns that entering KISS mode sets certain parameters.

So, if anyone out there has any insight on this - I'd appreciate it. If anyone has a PK232 and a MacSE running ka9q ... can you verify that in fact this works... or does not work... or disclose the incantation that will make it work.

Thanks,
  Gary (New packet user)

Is the TNC-2 source code (Z80) in the public domain?? I've got a platform that's got all the same pieces as a TNC-2 (Z80, CTC, SIO, ram, prom, etc) but all the stuff's at different addresses (it's also got a 9600 baud v.29 modem in it...) I'd like to make the TNC-2 run on this platform perhaps by just working the code over a little...

NOSINABOX is available now as part of the PackeTen product from Grace
Communications, a 68302-based packet switch board.

I'm the one working on ports to the AEA PS-186 and Kantronics Data Engine. I
am a couple of weeks work away from having an initial cut to pass around, but
I'm not likely to spend those couple of weeks for at least a month, because
we're trying to get some new RF gear up before snow closes our site... in
4-5 weeks.

See the paper I wrote with Don Lemley and Milt Heath of Grace in the ARRL CNC
proceedings from last weekend...

BTW: Anyone sitting on a spare set of 2m cans they'd like cash for?

Hello Packeteers!

I'm having trouble making a connection for my PK232 from my
HW5400. Reception is fine but for the transmitter I can key the
PTT but can't get any signal to go into the audio line.
Has anyone here had any dealings with the Heath HW5400? I have the
wires according to the book's diagrams (and hope thats the way the guy I bought
the rig from put it together :))
but still am not getting any modulation (BTW, the microphone works fine)

I see that L.L. Grace (of Kansas City Tracker fame...) is now
advertising their DSP modem. Looks like a very nice box..

Anyone have any comments on this particular design as compared
to the TAPR or AEA designs (hello Bob N4HY...) ??

Anyone know if the new dual band Kenwood, the TH-77, is available in the U.S.
or not yet. They're already importing the new smaller single band units (at
least they've been advertising them).

Also, does anyone have any mods for the Uniden Bearcat 200XLT?

Thanks.

The Harris RTX-2000 is a RISC high speed Forth engine (no, that isn't
an oxymoron in THIS CASE ;-) which has many of the attributes of a DSP
chip. I won't go into the details here. It IS being used as both a
DSP chip and as a disk controller on the ram disk on board.

This is part of the RUDAK experiment that was built by the AMSAT-DL
RUDAK group in Munchen, Deutschland (Munich, W. Germany). This will be
RS-14. It will be called Radio Oscar 21 after launch. This will be the
first SU launched satellite done in conjunction with one of the `western'
satellite building groups (AMSAT-DL/RUDAK) and with some participation
after the fact by AMSAT-NA folks. The group in the SU, in the spirit of
cooperation, etc. etc. have chosen to have it be the first satellite to
join the OSCAR numbering scheme. Just as UOSAT-A is UO-9, RS-14 will be
RO-21. Fuji-2 was FO-20 and this will be the next in line.

Bob

Howdy:

I had such great luck recently with the help needed message for the RTX-2000 that I thought I would try again. I need a couple of COSMAC 1802's. I could also use whatever manuals you may have such as programmers and user reference manuals. The indigenous system I have for it is a variant of FORTH (called IPS by its designer, DJ4ZC). This chip was originally done by RCA. If you have some laying around and have development tools you aren't using, let me know. The COSMAC 1802 is in the integrated housekeeping unit (IHU or OBC = on board computer) in Oscar 10 and Oscar 13 and planned for Phase III D.

Tim, I will do my best to answer your questions... I am posting to the net because I have received several pieces of email asking this type of question recently, and you seem to have asked some realistic questions....

> Basically, I'm starting from scratch, and need to have some idea of where to
> begin. I have a list of rudimentary questions like:
>
> 1) Just what *is* packet radio?

  Packet Radio is (yet another) digital transmition method available for use on Amateur Radio. It provides 'error free' transmision and reception of messages (information/data/etc.) between two stations. This error free capability is a prime consideration ('error free' in this context does not mean that your 'typing or spelling' mistakes will be fixed, but that all transmitted 'data' will be received 100% intact, as sent). In fact, if the data cannot be delivered 100% intact, the sending is aborted and the user is informed that there is no longer a 'connection' between the two stations.

  The 'Packet' in 'packet radio' comes from the method of transmitting your information over the air. Your 'data' is broken up into packets (or blocks) that are transmitted. Each packet contains the sending and the receiving station callsigns and some optional 'routing' information. A packet can contain from 0 to 256 data (or information) bytes. The users normally do not need to be concerned with this 'packetizing' of their messages. Each packet is sent and then acknowledged by the receiver when received. If a packet is not received correctly, then it is automatically re-transmitted (up to a maximum number of times).

  One of the more popular protocols used for Amateur Packet Radio is known as AX.25. This is very similar to the commercial X.25 standard. There is also a growing TCP/IP user base. If you are not network oriented, then the details of these protocols are not important to you as an operator of a packet radio station.

Be aware that most packet radio operation at this time is at 1200 baud. This will seem slow when compared to what it happening on networks, and on telephone BBS's.... but what is gained is world wide access, for NO COST. Once you have your equipment, and your license, there are no fees (except for the electricty that your computer and other equipment use :-))

> 2) What kind of equipment due I need, and how do I use it with my PC?

Since you have a PC, you already own the most expensive part of an Amateur Radio Packet Radio station. The other piece of equipment that you need is the TNC (Terminal Node Controller). The TNC contains all the software and special hardware that you need. It actually contains the MODEM (to interface with your radio) and (usually) a microprocessor with the packet software contained in EPROM. You interface your PC (or even a simple dumb ASCII terminal) with the TNC via serial RS-232. Use your favorite 'terminal emulation software' on your PC (the same software that you use with your telephone modem will probably work fine).

Most 'primary' packet radio operations occur (in the USA) on the two meter band. Check out the following frequencies (they my be different in your area, check with some local hams if you don't hear anything) even the typical 'police scanner' can be used to listen to these frequencies:

145.01, 145.03, 145.05, 145.07, 145.09 MHz
also, if the above are busy, many areas also use:
144.91, 144.03, 144.95, 144.97, 144.00 MHz

Yes, this is with a 'standard' FM radio set for SIMPLEX transmiting. If there are packet radio transmitions you should hear a sound like:

BBBBbbbbbrrrrraaaaaaapppppp

> 3) How much technical (hardware) proficiency is requied to manage a
> packet radio system? (I have a general understanding of computer
> hardware, but am more comfortable programming.)

Well, if you can plug an RS-232 cable into a modem, and wire the TNC to your radio (most TNC's connect to the microphone plug of an FM rig, normally only needing Push To Talk, and Transmit Audio. Plus a connection to the speaker audio output from the FM receiver), then you have all the ability that you need. If you are not comforatable with wiring a microphone connector... I am sure that there are hams that would be glad to help you.

It really is very simple, and once it is done, there is virtually no maintenance. Just plug in your TNC in place of your microphone and external speaker jack, and you're on the air... to return to voice operation, plug in your microphone. If you like, build a simple switch box to allow easy changing between your TNC and voice operation. I don't recommend it, but some wire the TNC and Microphone in parallel, so that they don't need to change the plugs, or switch anything at all.

> 4) Just what's out there for me to access via packet radio? (This is
> VERY important. I'm not interested in this as a pure hobby, I'm more
> interested in the resource potentials.)

Here comes the interesting part.... I believe that packet radio is still in its infancy... It seems like every day a new application for packet radio is announced... some are good ideas... others not.

Here is a *simple* list that just highlights some of the available uses of Amateur Packet Radio.. I am SURE that I have forgotten something and left it off the list:

EMAIL: At this time we have 'world wide' email distribution. I personally have received email from a few continents, and from all over the USA. Of course, this is limited by the Amateur Radio rules/regs, so there can not be any commercial messages.

Local networks: Here in New England we have connectivity over most of the 6 states. I can 'connect' to other stations from the following areas consistantly: Canada (Quebec), Vermont, New Hamphire, Maine, New York, Connecticut, Rhode Island. I should note that I am located about 10 miles north of the MA/NH border (in Derry, NH).

Of course, on HF there can be 'world wide' connectivity, depending on many factors.

PacketCluster-DX spotting: This is a specialized system that allows a couple hundred users to be 'connected' to the same system at one time. It is used by those Amateur operators who seek contacts with rare stations throughout the world. When any one user 'finds' a rare station on the air, he simply types the information (callsign, frequency and mode) into his terminal, and within a minute or so, everyone of the other users connected to the 'packet cluster' are informed of the rare station!!! So called "DXers" (people who love to hunt these rare stations) LOVE this system. These users can be spread over a wide area (our local packet cluster system has connectees from Maine to New York).

DOSGATE: A system that allows you to execute programs remotely. A DOSGATE system may have many programs for you to use over the air. You don't need to download the programs to use them, you are actually running programs remotely. For example, my DOSGATE system has the following programs available for use by 'remote' packet users:

AUTOEXAM: take the latest Amateur Exams from Novice to Extra, used as a study guide, or to see if you are ready for the licence exam.

SeeSats: Real time satelite tracking. Informs you of where the current OSCAR (and other) satelites are located.

AUTOCALL: Online Amateur Radio USA 'callsign' lookup database Simply enter the callsign of any amateur radio operator in the USA and it will print out the name, address, licence class and previous callsign (if any).

GAMES: Several 'adventure style' games that can be played online.

Repeater database: A database of many of the repeaters in the area.

DOSGATE allows those who don't have a computer to run programs via packet radio.

Gateways: Even though you may not own any HF or UHF equipment (many packet radio operators only use a simple 'hand-held' FM tranceiver), you can gain access to other bands and operating modes by using a gateway. A gatewary allowes connectivity between two normally un-connectable communication technologies.

Public Service: Many packet stations are used to help out with sending messages during disasters. Amateur Radio operators help out whenever they can, and many Hams have their packet stations ready for portable operation to help when needed. There are many 'training' exercises during each year to help practice and test the 'readyness' of the emergency stations.

OSCAR Satelites: OSCAR stands for Orbital Satelites Carrying Amateur Radio. We have our OWN satlites in orbit that are dedicated for Amateur Radio use. There are some satelites that are dedicated to packet radio (sometimes called "PACSATS"). Some of these are special, others are for 'store-and-forward' operations to help distribute 'packet traffic' around the world.

Station-Station: I almost forgot.. many people just like 'chatting' with their neibors.... The could be people across the street... or in the next state... or half way around the world!

I am sure that I have missed something... maybe others on the NET can fill in the gaps here. You asked about potential... as I stated at the begining, we are just getting started!!! Many people are just finding out about packet radio. I believe that the only limitation is our imagination!! We could have a world wide network (we do currently have a 'slow-speed' world wide network) in the near future... It just takes a little imagination...

> 5) How much will a packet radio set-up cost me? How COST EFFECTIVE is
> packet radio?

Well, if you own the PC already... TNC's can be purchased from about $120.00 on up. There are a few for less money, and several that provide for operating on many digital modes besided packet radio (i.e.: the Kantronix KAM will provide for: PACKET (HF:300 baud/VHF:1200baud), AMTOR, RTTY, ASCII, NAVTEX, WEFAX, CW (morse code),...).

If you already own an Amateur FM tranciever (or an HF SSB tranciever) then you have all the equipement needed. If not, a two meter FM rig can be purchased for: used: from $100-250.00, new: from $300.00 on up.

Cost effective.... Hmmm, well first be aware that Amateur Radio cannot be used for any commercial or business purposes... But where else can one get hours (years) of 'enjoyment' and service out of $450.00 ($350 for a radio and $100 for a TNC, assuming you already have the computer or terminal). Note: This stuff can be contageous.... be forwarned :-) !!

> 6) What legal issues do I need to consider regarding packet radio? Do I
> need a license?

Yes, you need a Valid Amateur Radio License. There is (in the Southern New Hamshire area) Packet radio activity on the Novice bands. But if you want access to the 'mainstream' of packet radio, you will want at least a Technician Amateur Radio License.

> etc.
>
> Pointers to reading materials such as books and magazines that my campus or
> local libraries might carry would be nice.
>
> Personal comments and insights into the world of packet radio would also be
> appreciated. I've tried reading the ham-radio newsgroups, but a *lot* of it
> is Greek to me.

There are a few books, etc... but I have found that most assume that you already know about Amateur Radio. You need to find what we call (ready for another term?) an "Elmer".... An "elmer" is a friendly, helping Amateur Radio operator who will 'take you under his/her wing' to help and guide you as much as you need. I hope that you can find someone to help you... it takes a special kind of person to be an 'elmer' (gosh I hate that term).

>
>
> Thanks in advance,
>
> -Tim
>

Good luck Tim.... Too bad you are not closer... I would be glad to help

Rich

Sorry if I got a little 'windy' with the keyboard here... I am getting ready to start a Novice class, and I always get 'pumped up' just before the class starts (tonite) :-).

I have an MFJ1278, firmware 4/3/90, which doesn't really get along with ka9q tcp/ip. In particular, the 1278 ignores the param ax0 255 command and stays in KISS mode even when the power is reset. MFJ little help so far. Anyone got suggestions. Even a description of the MFJ1278 implementation of KISS would be enough!

The quick-start book that came with mine says to issue TWO commands:
     param tnc 255
     param tnc 254

Not only is this non-standard, it's a STUPID decision (imho).

I just started subscribing to this news group and was wondering where I can
get a KA9Q software package??

[a wonderful summary of packet radio]

Rich--

Great posting! Would you be willing to maybe edit the specific
references to Tim's posting and turn it into a general Intro to
Packet Radio article that you could post whenever someone asks?
(Or maybe even automatically once a month [if that suggestion
doesn't get me in trouble with the INFO-HAMS gang!].)

My two cents worth:

>transmitted 'data' will be received 100% intact, as sent). In fact, if
>the data cannot be delivered 100% intact, the sending is aborted and the
>user is informed that there is no longer a 'connection' between the two
>stations.

Maybe say "is eventually aborted." When I read that, it sounded as
though sending was aborted as soon as there was trouble. The next
paragraph explains about packet retries, but maybe this sentence
could be softened a bit.

> Here is a *simple* list that just highlights some of the available uses of
>Amateur Packet Radio.. I am SURE that I have forgotten something and left it
>off the list:

1. Bulletin boards, which carry postings similar to the stuff on Usenet
and also often have archives of useful files (such as local ham license

testing sites). These are usually the same packet nodes that transport email.

I've found, however, that the discussions that take place on the worldwide ham PBBS (packet BBS) system closely parallel the ones on Usenet--and it's a lot faster to read Usenet! (As Rich mentioned, most packet operations are nominally at 1200 baud, but believe me, the actual throughput is a lot lower!)

The other annoying thing about AX.25 PBBSs is that once you start reading a message, you're stuck until it ends! Not like here on Usenet! (That isn't true when you're using TCP/IP to read a file, of course, since you have a separate control channel. But since most BBSs in the packet world use AX.25, it's something to keep in mind.)

2. File transfers. Better at 56 Kbaud (as some hams are doing), but feasible at 1200 baud. (Do you have to babysit AX.25 file transfers? On TCP/IP, you just start it and forget it, so you can do them overnight or at some other time when you don't care whether it takes a while.)

3. Databases. Rich alluded to this usage in connection with DOSGATE, but you don't need DOSGATE to offer this service. The two I can think of in this area are the HAZMAT (hazardous materials) and callsign databases. Both are available through regular AX.25 connections (the latter also through the TCP/IP "finger" command).

Thanks, Rich!

Patty

If you mean the "TAPR code", the answer is no. It's actually a bit complicated,
call the TAPR office and ask if you want to. I don't remember the details
offhand.

I don't know whether DED provides source for his TNC-2 EPROM or not, I doubt
it though.

The KISS EPROM written by K3MC has source included in the KA9Q TCP/IP
distributions. Look for the file tnc_tnc2.arc on the floppies.

The TNC-2 doesn't have a CTC...

Actually, it's on quite a few machines:

thumper.bellcore.com	Look in pub/ka9q
tomcat.gsfc.nasa.gov	Tomcat IS running NOS
hpcsos.col.hp.com	Good archive of net and nos
ucsd.edu	I saw a 890421.1 directory there. Havent looked at what is in it though.

Good luck, and have fun,
Jeff
PS: if you don't have internet ftp access, send me email and I will
dig up info on the WB3FFV bbs for you. You can get it there via
anon uucp or download from the bbs.

As quoted from <1392@necis.UUCP> by rbono@necis.UUCP (NM1D):
+---------------
| Yes, you need a Valid Amateur Radio License. There is (in the Southern
| New Hamshire area) Packet radio activity on the Novice bands. But if you want
| access to the 'mainstream' of packet radio, you will want at least a Technician
| Amateur Radio License.
+---------------

Not necessarily. In northeast Ohio, not only is there a major BBS on the
standard 2 meter Technician Class frequencies *and* the 220 MHz Novice Class
sub-band, but there are cross-band repeaters available as well. A Novice on
223.70 can connect to a station on 145.05 MHz by digipeating through TO505,
for example; the return path is via TO370.

To the LOGIN: on FTP type in "anonymous". For the password type in your E-mail address.

Once in, use the "dir" or "ls" command to look at the files in the current remote directory. Use "cd" to switch directories. Use "cd .." to go to the parent directory (at least on UNIX).

See a file you like? If it is NOT a text file, or if it ends in something like .arc .tar .zip .zoo .Z then use the "binary" or "type image" command to set binary transfer mode.

If you want to leave the name unchanged, just do "get" followed by the name of the file. To change the name, add yet another name on the same line as the new name.

Type in "quit" when you are done.

If you want to get really fancy on UNIX, you can get the file and put it into a pipeline. Suppose you see a file you like for UNIX and it is a group of files inside a single file called "foobar.tar.Z". You can get this file and uncompress it and untar it all at once with no temporary files needed. This is useful if you are tight on space but just barely have enough to hold the intended files. The command to do this in BSD UNIX would be:

```
    get  foobar.tar.Z  "|zcat|exec tar xvf -"
```

It will list the names of the files being extracted. Unfortunately the UNIX versions of arc, zip, and zoo do not read from pipes due to being ported from MS-DOS.

Louie,

  Use LHARC. It is also available for UNIX and VMS, as well as for the
venerable PC.

Best regards,

Paul

I forgot to comment on the hardware itself. The NEC v40 was my first choice for the AEA box, they rejected it since they had many man years in the Z80 and the 64180 would require minimal movement on their part. I believe this was a short sighted mistake. The bottom line is that we do have that code running and it works quite well. Brooks has a long history in writing multitasking operating systems for communications packages. He has written a multitasking kernal for the DSP-12. You will easily be able to add your own tasks to the running code if you so desire. This is a really nice feature for the inventive but I am not sure it is what Jon Q. Ham wants. On the DSP side, I can tell you Brooks DSP-12 is quite nice. It ought to be:

The AEA DSP-2232 has AD7870 A/D's, AD767 D/A's, Maxim 261 filter chips, Intel 85C30 for protocol, Signetic 571 AGC.

Need I tell you what is in the DSP-12? . . . . .

Bob

Hi Chris:

Brooks and I designed the AEA box and he learned a lot along the way and
is now in competition. As you might surmise, I am not at all happy about
it, and our partnership has dissolved. Everytime I go into some kind of\
relationship with a friend and it back fires I say to myself never again,
and I keep doing it. One of these days I will learn.

I had a long telephone conversation with Brooks a few days ago on another
matter. He and I discussed the DSP-12 and its status. I do have an interest
after all. The modems do not exist and the box has not passed or even been
submitted for FCC testing. I believe what he is doing in the advertisements
is unethical, but that is a personal feeling and not a `legal' opinion. The
`facts' about the modems and the FCC testing are what he passed along to me
and as I took detailed notes on the conversation to make sure that I quoted
him correctly ;-).

I spoke with Mr. Brooks yesterday regarding the purchase of a DSP-12.
I was a bit surprised that it wasn't ready after seeing the ad and all
in QST. (I seem to recall the new ICOM satellite rig being in the same
boat)

Anyhow, the picture in the ad is of the prototype. He said that a
booth will be set up at the AMSAT Conf. with the DSP-12 and other
goodies. I guess I'll just wait and see, but darn I'd like one now!

Hi,
I would like to write a program to display fax, and wefax on a Mac II
using a Kantronics KAM or an AEA PK-232. Where can I find the documentation
on how to understand the informations that these TNCs send to the serial port
of my Mac ? I mean: how can I detect the color of a pixel by reading the
serial port ? What signal of the rs232? Etc. Etc.......

I know there are some programs for the MS-DOS world: I have seen them
listed in wsmr-simtel20.army.mil archives: wefax.arc and autofax.arc, are
they in source form ? If so I could try to understand the protocol by reading
the source code....

Thanks in advance for any help.
Vincenzo.

>

Speaking for the PK232:
The only real way to do this is in host mode. You have to get the
tech reference manual from AEA for about $20.00 .

There is one thing you should know about the 232, and I bet it is
true about the KAM also - the FAX is totally fake. The TNC returns
a 1 or 0 that depicts what the demodulator is picking up. There are
no gray scales or colors involved. So the TNC returns a byte stream
that may be interpreted as pixel on or pixel off. It looks ok, but
it leaves much to be desired for sat images on the wefax transmissions.
The tones of a fax signal vary between 1500 hz and 2300 hz. The 232
can only hear 2 of these, the 1500 and the 2300. (actually 1200 and
2200 hz).

In summary:
The returned byte indicates if the 8 pixels are on or off. EG:
FF00FF would turn the first 16 pixels on, the next 16 off, the
next 16 on.......

Greetings. On Sunday, September 30, agreement was reached by the
federal budget negotiators on a proposed new budget, including a
variety of program cuts and new/increased taxes. Ignoring the other
taxes for the moment (e.g. increases in gasoline tax, energy tax,
social security taxes, etc.) there is one brand new tax in the
agreement that might be of particular importance to readers of this
forum. This is a new "luxury" tax of 10%. Details are sketchy, but
it apparently is proposed that this tax will apply on items such as
"luxury cars", furs, jewelry, and *electronic equipment*.

As this message is written, it is unclear what that latter category
would include. Would it include telecommunications and computer
equipment, or "only" televisions, VCR's, stereos, etc. above a
certain selling price? Would it apply only to individuals, or to
business use of such equipment as well? Would this tax simply be
added on to existing state and local taxes at the consumer level?

It might be worthwhile for everyone who is involved in the purchase
of "electronic equipment" to carefully track the details of this
significant new proposed tax as they come forth, and make their
opinions known to their House/Senate members (opinions phoned in *do*
get counted by their offices). At this stage, the budget agreement
has not yet been approved by Congress, and while the leadership will
no doubt wish to have the entire package accepted in one piece, it is
not necessarily the case that changes won't be made. It is important
that our representatives be informed about the feelings of the
technical community concerning these specific proposals.

The "someone" was originally me. Several years ago I published in the
proceedings of the ARRL Computer Networking Conference an analysis of
a go-back-N protocol (i.e., the LAPB sublayer of AX.25). I found that
on half duplex channels with a very wide range of channel bit error
rates it was always best to set maxframe=1 and vary the packet length

according to the quality of the channel: short frames on noisy channels,
long frames on clean channels.

While it is certainly true that you can sometimes improve performance
by increasing maxframe above one, you can always do even better by
keeping maxframe at 1 and increasing the frame size instead. This
does require you in some cases to increase your frame size beyond
256 bytes. This is common practice in the TCP/IP world, but it may not
be practical in the straight-AX.25 world since many TNCs have
hard-coded buffer sizes.

One thing you can do to substantially improve throughput even with plain
AX.25 is to stamp out the practice of triggering a packet each time a
newline is seen in the input stream, even if the packet contains only
a single character. Certain BBS packages are notorious offenders here.

>When tcp/ip (ka9q version) backs off due to channel congestion, does it
>wait longer between frames, reduce frame size, both, or what?

Both. When a TCP retransmission occurs, only the oldest unacked
segment is sent even if the flow control window had opened up. Each
successive retransmission interval is twice the proceeding one. It is
easy to see that even over infinite time such a system will consume
only finite channel time (consider Zeno's paradox). This behavior
makes the system unconditionally stable no matter how many
transmitters you have.

Phil

According to the Wall St. Journal, Monday, 1 Oct, p. A7, column 2:

"Another candidate for the luxury tax discussed that would have hit many Americans -- a 10% levy on electronics equipment with price tags over $100 -- was apparently dropped from the final package."

This is not to say that you shouldn't lobby your congressperson to prevent them from putting it back it. However, at the moment, it is not part of the package.

Sounds good Brian. I do disagree with you on the hang-time issue tho'. My repeater worked just fine with no hang time because it would go from nothing to full output in just a couple of microseconds. How? I keyed the last multiplier and left all the other stages running all the time. Since all the driver stages run class-C they are cut off without drive so no output and no noise.

The transmitter was keyed by a 2N2222 keying the emitter of the last multiplier. A TTL or RS-232 high on the base of the 2N2222 (through a current limiting resistor, of course) would pull the emitter of the last multiplier low and generate RF.

Keying transients were a problem at first. Standard CW keying shaping techniques get rid of the transient keying products. I used a small capacitor right at the base of the 2N2222. Even with that the transmitter can be made to key MUCH faster than anything else in the system. It also avoids all the problems having to do with detecting a carrier. Existing stations do not need any modifications to use the repeater.

I'm in the process of building a full-duplex digital repeater to serve
packet user in my area, and I've been experimenting with some stuff I
thought might be of interest to others.

Initially, I hacked up a TNC-2 to act as the repeater's FSK regenerator.
That's an easy job: for regular vanilla AFSK 1200 bps you just:

- add a diode and capacitor to the gate circuit of the VN10KM PTT switch
to give it a delayed drop out time of about 10 to 12 seconds - you want
it long enough that the repeater stays keyed up between retries.

- add in two diodes so that the FSK chip unsquelches and the PTT is keyed
whenever either the SIO chip asserts RTS (i.e., the TNC firmware wants
to say something packetish) or when the XR2211 detects carrier (someone
blew a packet at the box).

- add a data selector (I use a 7400) so that the FSK modulator is driven
from the FSK demodulator unless the SIO chip asserts RTS. That repeats
data but lets the firmware override for IDs and such. (Since the TNC
is NOT in full-duplex mode, it will hold off whilst repeating a signal
since it thinks the channel is busy.)

This trick works fine with regular TNC firmware, Net/Rum, or KISS mode
stuff.

However, I'm trying to add a K9NG modem to make it ALSO do 9600 bps,
and WB6HHV and I found out a few things whilst experimenting this
weekend:

2-meter Motorola MICORs don't like to do FSK. I suspect I'm going to
have to swap out the standard transmitter channel element with one of
the ones intended for 450 MHz use and modulate the thing through the
AFC circuit in order to get direct FM.

2-meter Motorola MAXARs do really nice FM. It appears the modulator is

linear to well beyond +/-8kHz dev, and to well above 10kHz audio if you go into the PL input.

Both MICORs and MAXARs seem to have a receiver modulation acceptance of around +/- 7kHz before a 1 kHz sine wave distorts measureably, and the K9NG stuff set to 3kHz seems to be received just fine.

By cutting the trace on the K9NG's FET analog switch that normally drives the FSK output with 1/2 clock during receive, and routing the output of the receive data slicer there, you make the K9NG act as an FSK regenerator when it's in receive mode, and act normally in transmit mode. That causes it to act just as the 1200 bps stuff described above acts.

The K9NG modem data slicer seems to be able to separate out 1200 bps AFSK - with the FSK regen modification described above, it seems to repeat 1200 bps packet just fine. I suspect it isn't as good as the 1200 bps AFSK regen described above, since it will not regenerate the tones themselves, but it is good enough that 1200 bps gets through the repeater without hassle. But then, it's not hard to arrange an audio switch to mute the K9NG modem's output when the 1200 bps DCD sees a real carrier - the 1200 bps modem (XR2211 with TAPR DCD mod) does NOT see 9600 as 1200 bps carrier.

I suspect that ANY FSK or FM-AFSK signal would go through this, which really makes the repeater pretty useful. Since the primary usage of the repeater is supposed to be 9600 bps with 1200 bps as a secondary accomodation, maybe that's the right answer. And it keeps the old farts from trying to talk on it.

So, what's the problem?

The K9NG modem has a truely dreadful carrier detect circuit. It works as follows: there is a bit in the standard TAPR state machine digital PLL prom that isn't used in calculating the next state; it's D7 (pin 19) on the prom. It's normally high whenever the PLL is locked, but pulses low whenever there is an error term in the PLL. Thus it will sit high on good carrier, and sputter low on random noise. By using it to dump the charge on a capacitor, and inverting that, you can get an output that will go low when the PLL error bit stays high, as it will when good data carrier is being received. However, it will also give you no error (and therefore, asserts carrier detect) when there is dead silence on the channel - like during the repeater's hang time. That means that the repeater has to generate white noise during the entire delayed drop-out time, or else EVERYONE has to modify their K9NG modem to ignore dead carriers - a non-trivial task. (You can do that by adding circuitry to look for the data slicer toggling, which it won't do on a dead carrier, and ANDing that with the state machine output.)

Well, if we want people to be able to use 9600 bps, we have to either have no hang time or blow white noise during the hang time. But if we do the latter, the typical 1200 bps user's TNC will see the white noise as data carrier (since most of them are really energy-detect circuits,

not data carrier detectors), and they'll hold off. It's essentially the same as blowing the squelch on the user's receiver.

Having no hang time at all is a bad idea - the transmitter can't get on the air fast enough to allow the really short TXD times that you can use if the carrier is already up, so that will degrade performance for all users. (We've successfully run with TXD set to 2 [20ms], which is 1/10th the delay used on simplex around here.)

I don't mind degrading performance for 1200 bps users a little bit if I have to, so I've considered blowing white noise for like two seconds after any input signal goes away - the K9NG modems would see that as an available time slot, so a 9600 bps user would be able to transmit immediately. People with good DCD 1200 bps systems would also be able to transmit immediately, but people with typical cruddy 1200 bps DCD circuits would have to wait for the blowing to stop. Perhaps the two second delay isn't that bad. Maybe even pulsing the white noise on and off at a two second rate during the 10 second hang time is the right approach.

Suggestions? Comments?

A note: it's been suggested that having the repeater just toggle between 1200 and 9600 bps modes based on which it heard last. That has some merit, but if the TNC at the site is to be able to link the repeater to other facilities, since it can't know which speed to transmit at when the packet arrives from off-system. We're going to leave the TNC and networking stuff running at 9600; the 1200 bps people only get a repeater. Perhaps that will be incentive to up their speed.

hello, pac-radio enthusiasts!

i am thinking of joining your ranks, but am in need of advice as to what to buy. Recently I have been talking to the local reps of DataRadio (HQ in Quebec,

Canada), who carry a complete TNC-VHF radio combo that is quite pricey. I am in need of a data link over radio waves that works at a range of about 50 miles, and has decent error-correcting capabilities <especially during thunderstorms>. I would think that a regular TNC and VHF radio would suffice, but I am told that regular radios will probably only work at 1200-2400 baud? Supposedly regular radios have high attack times and turnaround times (approx 300 ms) as opposed to dataRadio's (2-4 ms), and are suspect to frequency-drift, which cause reception problems?

any info you guys can give is appreciated, especially e-mail addresses of other TNC/pac-radio manufacturers.

thanks,
joel disini

**** UoSAT-OSCAR-11 BULLETIN 30 September 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UO-11

Suggestions on the most useful operating schedule for UoSAT-2 should be sent to UoSAT as soon as possible so that they can be taken into account during an operations review due to take place later this month.

** FO-20

FO-20 is continuing to experience high temperature problems (due to the spacecraft experiencing no eclipse periods during which it can cool down) which is forcing a drastic reduction of operations. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

From		To		Mode
011090	0900	021090	0910	PSK Telemetry acquisition
041090	0955	041090	2330	JA
081090	0920	081090	1110	JA and JD
111090	0825	121090	0850	JD

The above dates and time are in UTC and the schedule may change without notice. The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

** MIR

A new and exciting amateur radio project is being planned for the Mir space station known as the "Amateur Radio Experiment on Mir" or AREM. This project

is the result of a collaboration between the Soviet Union and the Austrian Amateur Radio Society (OeVSV). It is designed to provide equipment for both 2M packet data and voice transmissions from Mir. The voice messages will be spoken in German, Russian, and English and will alternate with packet transmissions. The first AREM operations are expected to begin around January 1991 when an Austrian cosmonaut will install the station after he joins the crew of the Mir. To obtain further information about AREM, please write to:

Wolf Hoeller (OE7FTJ)
Amraserstrasse 19
A-6020 Innsbruck
Austria

** AO-13

The present transponder schedule for AO-13 is as follows:

```
Mode-B          : MA 003 to MA 165
Mode-JL         : MA 165 to MA 195
Mode-B          : MA 195 to MA 240
Off             : MA 240 to MA 003  (Mode B Beacon On)
Omni Antennas   : MA 240 to MA 060
```

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

** AO-10

Until further notice please DO NOT use AO-10's transponder.

** BADR-1

Would any stations receiving signals from the BADR-1 spacecraft on 145.825 MHz and 144.010 MHz please send brief details to UoSAT - thank you.

Thanks to AMSAT-NA ANS and its contributors for much of the above information, there is generally insufficient 'room' in the UO-11 Bulletin to give regular acknowledgements.

** $BID **

Please use BID $UOSAT.930 for PR BBS use.

This message is to announce the availability of version 3 of my LZW compression protocol. The current implementation is for the KA9Q Internet Package (NOS) where it can operate on TCP, NET/ROM and AX.25 connections. But it should be possible to port this implementation to other software, such as dedicated BBS'es.

The compression algorithm works similar to the way GIF files are compressed. The major difference between straight LZW and GIF is that GIF uses a variable size for the codewords. My implementation also uses variable size codewords.

The compression routine looks at data as 8 bit words and begins coding input strings as 9 bit codewords. As the codewords get used up, it increases the size to 10 bits, and so on. When the maximum codeword has been reached, it clears the code table and restarts with 9 bit long codewords.

It is possible for an application in NOS to specify the maximum number of bits to use for codewords, and hence, what the maximum codeword will be. The valid range is 9 to 16 bits. At 16 bits, there can be 65535 different codewords. That might not seem like very much at a first glance, but at that point NOS will use 192 kbytes to keep the code table, which should make things pretty tight.

I have tried to optimize my implementation in a memory efficient way, that will however make the compression somewhat slow. But since it is intended for 1200 Baud AX.25 links or SLIP links, I guess it will not matter all that much. For those who are concerned about processing speed, it is possible to specify an alternate code table algorithm. It computes faster, but needs more memory. A code table using the "compact" algorithm may grow to about (2^bits * 3) bytes, where 'bits' is the maximum number of bits a codeword may use. The "fast" algorithm may have to use up to (2^bits * 5) bytes.

Which algorithm to use, and how to set the 'bits' limit, is a policy decision. A larger 'bits' value increases the efficiency of the compression algorithm, but it uses more memory and takes longer to compute. The "fast" coding algorithm reduces the computing time, but needs even more memory.

LZW processes groups of characters when encoding. This is no problem when compressing files, but on a network connection there are times when this approach is not practical. For instance, when you press the return key, you probably want what you have typed to be sent immediately. But LZW wants to hold on to the data because it needs to know what you intend to type after you have pressed the return key, so that it can compress what you typed more efficiently.
I have solved this by interrupting coding whenever the output buffer is flushed (by pressing the return key for instance) and signaling this with a special flush codeword.

LZW is somewhat inefficient on interactive terminal traffic, since there is lots of pressing of the return key. It works better for batch traffic, such as mail forwarding, where packets are longer than 80 characters.
It is especially inefficient when one operates in remote echo mode ("full duplex") because then every coded character has to be followed by the flush codeword. This is particular mode of operation makes my LZW two or three times less efficient than without "compression."

There is also a special codeword ZCC which will cause an immediate clearing of the recievers code table and setting of the current bit size to 9 bits. This could be used to preempt low priority transfers when NOS needs more memory for other tasks.

The LZW implementation sits in the socket library, and works on top of any stream based socket, such as TCP, AX.25 or NETROM.
All the application needs to do is to make the following call:

```
lzwinit(s,bits,mode);
```

where 's' is the socket descriptor. 'bits' is an integer between 9 and 16 specifying the maximum number of bits to use for each codeword. The compression code table will always use this or a lower size, but 'bits' should only be regarded as a recommendation with respect to the decompression code table. 'mode' specifies the compression algorithm and should be either LZWCOMPACT or LZWFAST. Data should be sent and recevied with usprintf(), usputc(), recvchar(), recvline(), etc. Calls to send(), send_mbuf(), recv() or recv_mbuf() will bypass the coding, which obviously will cause strange effects.

One of the better uses for the LZW compression is to transfer mail. It should be noted that a connection for transfering mail might be left connected even while there is no mail to transfer, to save the code table. It would be very inefficient to transfer only one single piece of mail for each connection, since the LZW code table has to be

rebuilt each time.

In the case of transfering mail with SMTP, I see two different approaches. One is to have a special ZSMTP server that runs on a different TCP port. The other is to have the client connect without using compression, and then issue a special command, such as "XLZW." If it is accepted, transfering of compressed mail can begin. However, some SMTP server implementations panic when they get an unknown command and close the connection, instead of sending a "500 command unrecognized" response.

The source for the LZW implementation is available with ftp from sics.se. The filename is archive/packet/ka9q/nos/lzw.arc. The files in this archive are supposed to be merged with a recent version of the NOS source code which is available from thumper.bellcore.com. The archive contains no applications using LZW however, modifying Telnet or SMTP to use the compression is left as an exercise for the reader.

I encountered, and fixed, a problem with my DSY modem quite some time I ago that I didn't bother mentioning to anyone, assuming that it was just an isolated quirk. Recently however, the same problem was discovered in VE3MDL's modem, so it may be more widespread than I thought. Time to tell the world!

The symptom of the problem is excessive DCD falsing. If you find that you really have to crank up the threshold control to stop the falsing, or if your DCD lights up more or less steadily when you remove the input to the receive side of the modem, then you've probably got it. The basic cause is that the MC3359 FM demod chip doesn't have enough gain ahead of its limiter, and under no-signal conditions the noise level isn't high enough to cause full limiting, so the noise is relatively low (i.e., lower than the eye pattern amplitude when a signal is present). Since the modem DCD circuit thinks a

lack of noise equals signal, it declares carrier detect.

In poking around the 3359, I discovered there was a low frequency oscillation present on some of the pins. I don't remember exactly, but I think it was in the 100 kHz region, and several volts in amplitude. The oscillation seemed to be related to a problem with power supply decoupling in the 3359 or the preceding IF amplifier stage. The cure was to add a bypass capacitor of at least 0.15 uF on top of the board, from the lead of the fixed inductor L4 at the end nearest the 3359, to ground. This also improved the gain ahead of the limiter and greatly improved the DCD falsing problem. I've heard a number of complaints about the DSY DCD circuit - I wonder if this problem could be part of the reason?

While I'm on the subject... If you run the DSY modem in a full-duplex link, or if you keep the tx side of the modem running continuously for any reason (like minimizing the keyup time, as I've often advocated), be aware of a potential problem. The DSY encoder board contains a 3.579 MHz oscillator which is keyed by the RTS line, and its 3rd harmonic at 10.739 MHz falls smack into the receiver first IF (thanx to VE3MDL for first pointing this out). If enough of it gets into the modem receiver, it will cause both desensing (higher BER on weak signals) AND DCD falsing. To see it's a problem in your modem, put a scope on the eye pattern (TP1 of the decoder board) and key the tx side. Under no-signal conditions, you should see plenty of noise, with peak-to-peak amplitude a bit more than the eye pattern of a valid signal. If leakage from the encoder oscillator is present, the noise will be lower in amplitude and "scrunched up" around one level (offset from zero, since the birdie is not centered in the IF). In my case, with the modem boards spread out in the same horizontal plane in an aluminum chassis, the leakage is quite severe with the cover off, but barely noticeable if it is tightly fitted over the encoder board, and hopefully completely gone with the cover fully on (refrigerator light bulb syndrome :-). Your mileage undoubtedly will vary, especially if you stack the boards, so check it out.

Greetings. Good news. It took a bunch of phone calls to pin this down, but it *appears* (for the moment) that the proposed 10% electronics tax did not make it into the final draft of the budget agreement that is currently under consideration. As late as Monday afternoon, personnel at our U.S. Senator's office believed the tax *was* in there, and that it *would* affect computer and telecommunications equipment, as well as consumer electronics. Other sources gave the price level at which the electronics tax would kick in as either $100 or $1000, depending on who you talked to. Meanwhile, on Monday morning, the Wall Street Journal published an article saying the electronics component of the tax was *not* in the final agreement. So there was considerable conflicting information.

Much of the confusion apparently revolves around the many drafts of the agreement and the incredible flurry of activity involving consideration of the budget.

In any case, according to a phone conversation I just had (Tuesday, around noon, PDT) with a Wall Street Journal writer who was by far the best versed on this topic of anyone I had reached anywhere, the 10% tax on electronics equipment is indeed *not* in the present agreement. According to current info, the 10% tax *would* apply to:

    Furs over $5K (except leather and artificial fur)
    Jewelry (including watches) over $5K
    Private boats and yachts over $100K
    Autos over $30K

This is all to take effect this coming Jan 1 if the budget agreement passes.

The electronics tax was indeed in the agreement originally, but was dropped from the final draft, apparently.

It is important to note, however, that this is all subject to sudden change. The electronic equipment tax could reappear at any time in the negotiations, either now or later. So it would be a very good idea to keep as close a track of the developments as possible, because if changes occur we probably will have VERY little time to react and let our opinions be known. And of course, there are many other aspects of the budget agreement, in terms of other taxes, fees, program cutbacks, etc., that are also very important, and about which our representatives would appreciate our input, I'm sure. Apparently they haven't been getting very many calls about the budget, and they really are interested in hearing voters' opinions when you call.

Given how difficult it is to obtain basic information about something as important as the budget, the more people in the technical community keeping abreast of what's going on, from different angles, the better!

Greetings,

Last night I went to a committee meeting of the North-West Packet User Group (NWPUG) and it came apparent that we are having routing problems in the UK in that Packet mail is not always reaching its destination outside the UK.

We are trying to track down the problem, and were wondering if all the people on these two lists were to send one short message to me on packet plus a copy to me here at work (so that we know how many messages to expect), it would help us to plan the forwarding a bit better.

Subject: Re: Maxframe == 1 (ka9q)

Tks for passing that along Dave.
There is another reason (or maybe it helped cause the conclusion that PhilK
reached). AX.25 cannot request a "fill." All packets after a damaged packet
must be retransmitted. That makes the "average size" of a retry to be some
multiple of a packet > 1. For example, Max 3 retries average about 2 packets
per retry ... plus the greater retry size has more errors, etc ....
When maxframe is ONE, the average size of a retry is also ONE (plus the error
rate.)

Both NetRom and TCP/IP can request fills for missing data. N/r by packet
number and TCP by byte number. Both buffer what was received after the bad
spot so the ACK point can advance as soon as the fill is recvd.

The following is primarily of interest to Southern California stations,
but just to give the rest of you an idea of packet usage here on the
left coast....

SCDCC and TASMA are the So Cal Digital Communications Council and Two
meter Area Spectrum Management Association, respectively. Somewhere
along the line they seem to have arrogated coordination of packet nodes
and simplex frequencies to themselves, and a large number of hams tend
to go along with them. (This may be beneficial, but I can't help but
feel uneasy about it...)

Anyway, the latest bumf on frequencies and usage:
- Brian

SOUTHERN CALIFORNIA TWO-METER PACKET BAND USAGE PLAN

28 JULY 1990

The following Band Usage Plan for Amateur Packet operations in Southern California was adopted by the Southern California Digital Communications Council (SCDCC) Board of Directors on 28 July 1990. The purposes of this plan are:

1. To provide the Southern California Two-Meter Area Spectrum Management Association (TASMA) with a Plan for the utilization of the additional 200 KHz of spectrum earmarked for future allocation to digital modes. This additional spectrum was added to the Two-Meter Band Plan by vote of the TASMA General Membership at their Annual Meeting held in June. A provision of the action taken at that time was that the SCDCC was to provide the TASMA Technical Committee with a Usage Plan for the new frequencies in order that TASMA would be aware of the general plan concepts.

2. To establish a baseline Plan which can be used by the SCDCC Board of Directors in performing their tasks of "coordinating .... the activities of the many specialized interest groups and individuals using Packet Radio, ... and developing recommended standards regarding .... elements of network design and implementation" as defined in their Bylaws.

The plan is based upon the following understandings and principles:

A. The Two-Meter Band is currently, and will continue for some time to be, the primary set of frequencies used for User level access to the resources and facilities available in the service.

B. The Frequency of 145.01 MHz is designated at the National level as being for inter-LAN use and is generally accepted as the "packet calling frequency." This is being interpreted in Southern California to mean that this frequency should provide a maximum of network access opportunity for the general user but should not be directly inhabited by high intensity services like BBS's, Public MailBoxes, File Servers or Gateways. Low-level cellular Nodes accessing the Network via secondary frequencies are preferred.

C. A network architecture combining the concepts of a hierarchal frequency structure and cellular area design will provide the most effective system for Southern California and will offer the greatest opportunity for maximum individual and group involvement in the development and use of Packet Radio. NET/ROM and NET/ROM compatible networking software/firmware is the current standard for the region.

D. Establishment of a Band Usage Plan as compatible as practical with adjacent areas is in the best interest of all concerned. Specifically, frequency use assignments recognizing prior designations made by the Northern California Packet Association (NCPA) have been considered.

E. Occupancy of the new packet frequencies between 144.9 thru 145.0 and 145.6 thru 145.7 will not occur until the frequencies have been released by TASMA. At that time, stations will be expected to adjust their operations to conform with this plan. It is suggested that stations providing Network services forward information regarding their intentions to use any of the new frequencies (or move their operations on existing frequencies) to the SCDCC in order that possible conflicts can be identified as early as possible.

F. Hopefully all aspects of Packet Radio operation have been considered in the development of this plan. Certainly, those interested in providing an input to it have had that opportunity. The broad representation provided by the structure of the SCDCC Board of Directors has helped to insure that this is the case.

G. Even though the DX Spotting Packet Network (DX Clusters) have chosen not to participate in the SCDCC, their needs have been included in the plan and DXSPN participants will be expected to adjust their operations accordingly.

PACKET FREQUENCY USAGE DESIGNATIONS

DX SPOTTING - DXSPN User access channel. 1200/2400 BAUD. No Inter-node linking. (See Notes on specific frequencies.)

EXPERIMENTAL - The frequency is set aside for narrow-band experimental activities. Initially included are operations at data rates of greater than 2400 BAUD although additional channels will be converted to higher speeds as the need arises. IF YOUR OPERATION IS INCOMPATIBLE WITH OTHERS ON THE SAME FREQUENCY, YOU BELONG HERE.

KEYBOARD - The frequency is intended for use by operators who wish to make keyboard to keyboard contact. NET/ROM and Gateway stations are permitted as long as they do not interconnect with non-keyboard frequencies. Private MailBoxes are allowed as long as they don't try to serve multiple individuals or perform automatic forwarding. Conference Bridges may be acceptable if operating hours are restricted.

LAN - The frequency is intended to serve as a Local Area Network channel in conformance with the cellular area of service concept. LAN's may or may not be serviced by NET/ROM Nodes providing off frequency connection to the Metropolitan and Wide Area Networks. BBS service at the LAN level is encouraged. Inter-LAN forwarding on the two-meter frequency

is to be avoided. Typical service areas are expected to be defined by natural geographic boundaries. Power levels and antenna heights should be adjusted to provide for maximum frequency re-use.

TCP/IP - The frequency is intended for use by operators and services utilizing the TCP/IP Protocol. Maximum use should be made of Area Routers and IP Gateway stations. NET/ROM Nodes on these frequencies may interconnect with off frequency Metropolitan and Wide Area Networks but should minimize the number of Nodes added to the Network by supporting designated Gateway stations.

PACKET FREQUENCY USAGE ASSIGNMENTS

144.91 MHz. KEYBOARD Channel. Corresponds with allocation in Northern California. Expect some 145.09 NET/ROM Nodes to move here for linking purposes. FREQUENCY NOT AVAILABLE AT THIS TIME. ADJACENT FREQUENCIES IN USE.

144.93 MHz. TCP/IP Channel. Corresponds with limited allocation in Northern California. FREQUENCY NOT AVAILABLE AT THIS TIME. ADJACENT FREQUENCIES IN USE BY COORDINATED REPEATERS.

144.95 MHz. DX SPOTTING. Corresponds with allocation in Northern California. Requires cooperation with infrequent SPACE operations. FREQUENCY NOT AVAILABLE AT THIS TIME. ADJACENT FREQUENCIES IN USE BY COORDINATED REPEATERS.

144.97 MHz. LAN Channel. Corresponds with allocation in Northern California. FREQUENCY NOT AVAILABLE AT THIS TIME. IN USE BY COORDINATED REPEATER.

144.99 MHz. EXPERIMENTAL. FREQUENCY NOT AVAILABLE AT THIS TIME. ADJACENT FREQUENCY IN USE BY COORDINATED REPEATER.

145.01 MHz. INTER-LAN Channel. No high intensity services. See Notes above. Available. Most existing high-level Nodes should be converted to a MAN or WAN frequency.

145.03 MHz. KEYBOARD Channel. Available. Corresponds with allocation in Northern California. Expect development in compliance with cellular concept. Existing non-complying services will be asked to move when frequencies become available.

145.05 MHz. LAN Channel. Available. Existing users should convert to comply with cellular concept as soon as practical.

145.07 MHz. LAN Channel. Available. Corresponds with allocation in Northern California. Existing users should convert to comply with cellular concept as soon as practical.

145.09 MHz. EXISTING: KEYBOARD Channel. Will remain as KEYBOARD Channel

until 30 days after 144.91 MHz. becomes available.
FUTURE: LAN Channel. Corresponds with allocation in Northern California.

145.61 MHz. LAN Channel. FREQUENCY NOT AVAILABLE AT THIS TIME. COORDINATED SIMPLEX AUTOPATCHES BEING RELOCATED.

145.63 MHz. LAN Channel. FREQUENCY NOT AVAILABLE AT THIS TIME. COORDINATED SIMPLEX OPERATIONS BEING RELOCATED.

145.65 MHz. LAN channel. FREQUENCY NOT AVAILABLE AT THIS TIME. COORDINATED SIMPLEX OPERATIONS BEING RELOCATED.

145.67 MHz. DX SPOTTING. Available. Existing DXSPN stations on 145.68 MHz. may move to this frequency as appropriate (see discussion below).

145.69 MHz. DX SPOTTING/LAN. Available for DXSPN stations prepared to comply with cellular concept installation. Application should be made to the SCDCC. Frequency will be used for both DX SPOTTING and LAN environments in compatible adjacent areas.

NOTE: TRANSITION OF DXSPN STATIONS - Existing DXSPN stations have the following choices. The 145.67 MHz frequency is currently available for occupancy and does not require conversion to a low level cellular site. Some stations on 145.68 will probably want to make such a move in the near time frame. The alternative to making such a move at this time is to wait until 144.95 is available where again compliance with the low-level requirement will not be initially applied. When 145.69 is made available, it will be open to low-level cellular compliant stations. It is expected that DXSPN members will coordinate amongst themselves to ensure a smooth transition to the new frequencies and that application for use of 145.69 will be made as described above.

Does anyone out there know if there's a version of the KISS code code
that will cope with 9600 baud (from a G3RUH modem). The standalone
versions that I currently have send a lot of rubbish data to NET. The
version built into the 1.1.7 ROM seems to function okay, but requires
32K RAM in the TNC.

Source would be nice if there's any available, but binary or intel hex
files are fine...

Unfortunately I have no FTP facilities, so pointers to such sites are
of little use... uucp, e-mail, info-servers etc are all fine...

Thanks in advance,

     Nick

Could someone please help me? I would dearly like to get a hold
of the amiga version of NOS. I found it on WB3FFV, but WB3FFV isnt
pc pursuitable and I didnt want to spend 40 minutes worth of SPRINT
time to download the 600k+ archive. My network site obviously has
uucp but its internet connection is rarely used. I checked on
thumper.bellcore.com but was unable to make heads or tails of any
of the files there. If someone knows what machine on internet
its on and what directory and file name I would be more than happy
to ask my sysop to fire up his telebit and SLIP it on down the line.
He says the FTP costs are minimal.

Thanks in Advance,

Jim Burnes

The following is in reference to the KAM (actually all Kantronix TNC's, even
the KPC-2 has this ability):

  Well, they give all the information that you nead right in the owner's manual.
When I received the version that had the FAX capability I immeadiatly wrote a
program to make use of the information... It is fairly straight forward.

  Once you place the TNC in 'WEFAX' mode, the modem simply samples the
incoming fax signal and then outputs a series of bytes. Be aware that these
are DIGITAL modems... that means no grey scale (or color) information is
presented at all. The fax signal could vary from black through grey to white.
The TNC's modem will 'see' all shades from about the mid-grey shade to black
as black.. and anything above this shade as white. This is not too bad as a
lot of the weather maps are sent as 'line drawings'... But don't expect good
results with images such as cloud cover or news pictures.

The data stream from the TNC is a series of bytes. For example if the following stream of bytes was output (shown here in hex):

0xff 0xff 0xff 0xff 0x55 0x55 0x55 0x55 0x00 0x00 0x00 0x00

You would consider each bit of each byte a pixel, if the bit is a '1', then turn that pixel, on... it the bit is '0' then turn that pixel off. So the data example would be 32 pixels on, followed by the next 32 pixels where every other pixel was off, followed by 32 pixels that are turned off. You just grab the bytes, place them into your video memory (in the proper manner to turn the pixels on/off), and about 10 minutes later, you see the wefax image.

The 'AUTOFAX' program on SIMTEL20 is my program that does just what I describe... it is really simple and dumb... Sorry, the source it not included. This was a quick hack that I did to see what wefax was all about... I found that it was kind of fun, but I got bored with it rather quickly (I couldn't stand to wait the minutes that it took for the pictures to appear). I didn't develop the program any further because Kantronix and other manufacturers finaly released their programs to do the same.

Hope this helps,

Rich (NM1D)

I agree. Conducting this experiment (no doubt) generated a lot of useful
data and experience. What bothers me is that nothing appears to have ever
been published about the experiment and its outcome. Surely this information
should be shared with a wide audience.

If there have been paper published about this, I would appreciate any and
all references. Thanks.

>submitted for FCC testing. I believe what he is doing in the advertisements

I just spoke with him (Brooks Vantel, KB2CST, (301) 266 2966) and he
confirmed that the DSP-12 hadn't made it through FCC type approval
yet. And yes, he was taking orders and had a waiting list going.
Hmmm. The thing that worried me was that the programmer's guide was
the *last* thing on his to-do list - I won't make a buy descision
until I've seen that. He did say, though, that the firmware sources
would be available through a non-disclosure agreement.

Disclaimer: your mileage may vary, & c. & c. I suggest you phone
KB2CST if you want "horse's mouth".

BTW, anyone have a number for the *other* Grace Communications? I am
trying to get a line on the PackeTen 68302-based board (and truth be

told, I'd a lot rather hack a 68xxx machine than an 80x86-flavoured
one, any day. The learning curve will be a lot less steep for me.)

Yes, ARRL has all 9 of them available. The first four are in a single
volume; the remaining five are in individual volumes. Contact ARRL HQ
for details (203-666-1541).

Subject: KISS ROM set for Ashby TNC

Several years ago I purchased and used an Ashby TNC when packet
radio was just starting up. In the environmental spirit of things,
I'd like to recycle the unit and continue to use it with a more
modern networking system (e.g., the KA9Q NOS package).

In one of the earlier versions of the KA9Q documentation, there
was a reference to using (and I'm loosely quoting here) "... the
HAPN/Ashby board..." which I presume both used the Intel 8273
for HDLC framing.

Does anyone have information on whether there was ever a KISS ROM
set for the Ashby board, and if so, is there anywhere that I can
get a clone of it, or the hex listing to blow into a PROM ?

I'd appreciate any info on the subject matter someone might know.
Responses can be either to the mailing list or to:

     jhk@saturn.acc.com

Thanks very much.

John...   WB4LNM

I'm afraid this is as good as it gets [rec.ham-radio.packet] :-) . If
you are interested in TCP/IP, maybe you should subscribe to the
tcp-group mailing list. I think that a months worth of messages from
it could be considered 'kind of like a small magazine.'

Here is a small plug for the New England TCPer. This is a newsletter for our group here. Articles are user contributed and vary from issue to issue. Subscription is cheap:

It comes out every other month and Rates are:

1 Year for $12, 2 for $22, 3 for $32.

The address is   The NE TCPer
         252 Stow Rd
         Harvard MA
         01451

I could try sending a complimentary issue to anyone who asks. The compressed Postscript file is 128K. I have had problems sending things that big but could try again.

Anyone:

I have a question about using TCP/IP on packet radio.

How can you implement ftp or telnet over packet tcp/ip (even on high speed lines) if everytime it goes from one machine to another the person who runs that station has to inspect it for 'dirty words' or commercial transmissions. Telnet would run REALLY slow if every packet has to be intercepted by the station operator for a "bad word check".

Ooppss..cheated...i have one more question...

Is it possible to run mobile packet stations from cars or whatever over GRAPES/TCP/IP setup while the cars are moving. Sort of a roving TCP/IP network. I think it would be cool. Run those systems on portable pcs or regular pcs running off of power inverters.

Pardon me if these are ignorant questions...I'm new to ham and packet.

Regards,

Jim Burnes

Here is a tip for anyone using a Kantronics Data Engine with firmware 1.0. I could not get it to reverse forward to an MSYS bbs until I realized that the SID, [DE1.0], is not a valid SID. I changed the firmware so that it appears as [DE-H$]. Reverse forwarding works fine now. This data is at location $C2FD in the EPROM.

is there a map somewhere of all PBBSes worlwide? I'd like to know how it is
that packet radio messages get forwarded say, from Texas to Manila, or from
Australia to Poland, and how many "hops" it takes to go from point A to point B
<and what the links are between both points - VHF, HF, microwave?>.

I thought it might be of general interest to many of you if I made the
announcement of a new Conference - The Microwave and RF Forum. Accessable
directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)
--- GroupMail 2.17

Actually, the Ashby board is a clone of the Vancouver board but using some programmable logic to simplify things. The KISS firmware for the Vancouver board should run on the Ashby board as well. It's probably available on thumper.bellcore.com or col.hp.com via FTP.

Perhaps the best packet newsletter in the world right now is the NCPA Downlink.
It is published quarterly by the Northern California Packet Association. Most
of the authors are from Northern California, but the subject content is about
all kinds of packet, and most is not Northern California specific. Membership
runs on a calendar year basis from April 1st through March 31st. If you join
now, you will receive the Spring, Summer, and Fall issues immediately, and the
Winter issue when it comes out.

One of the local clubs asked me about the G8BPQ switch software, and I

don't know the answers:

1. What is the COMBIOS interface referred to in the documentation, and how is it used?

2. Can G8BPQ be used as a multi-tasking executive for simple programs? (presumably that don't do screen access - like a C program that only uses stdio.)

3. What kind of throughput can you expect on various types of machines?

In particular, the proposed configuration is to run a 10MHz XT with 4 or 5 radio channels attached to it. Two would be 9600 bps, one 4800, one 1200 bps. Probably KISS TNCs will be used, but maybe DRSI PCPA boards. There's some real concern that the XT might not have the horsepower to handle three medium-speed ports and one low-speed.

What if we added the fifth port with 56kb?

(This will be a standalone packet switch - no BBS on the system. It seems to me that if you wanted to have the thing do both switch and BBS you'd be better off running something like MSYS.)

Any comments?
- Brian

The documentation for the KISS proms indicates that Mike Bruski,

AJ9X is associated with a dedicated PROM for this. I would check
the callbook for his snail-mail address.

If you're asking particularly about 56K operations, I haven't tried
that. But I did some mobile TCP/IP (and AX.25) once while Phil and I
were driving around the San Francisco Bay Area. While he drove, I
played with a portable packet system we'd put together. It consisted of
his laptop computer (running off its own batteries), a handheld radio
(ditto), and I think my TNC-2 running off the car. The antenna was a
5/8-wave mag-mount on the roof.

I pinged a few TCP/IP base stations while we wandered around. I didn't
bother trying an SMTP or telnet, but there's no reason it shouldn't
have worked. I just didn't have any need to try it.

> What if we added the fifth port with 56kb?

If you put a 56kb modem on a DRSI PCPA card, any time you are transmitting or receiving a frame, the machine is flat-lined. All interrupts turned off. Even with 16550's on the asynch ports, my 10Mhz V20 clone at home loses characters on the two 1200-baud serial ports whenever a packet is sent or received. This is not a very acceptable situation.

If you use something like the Grace PackeTen card to provide the radio interfaces, all of the problems go away. If you use one of their standalone cards, you're even better off for a site... you'll get all the NET/Wrong compatibility anyone could possibly want... but nothing is free.

A friend of mine is looking for a site to communicate with. He just got the KA9Q software to run TCP/IP on his TNC and is looking for someone else he can hit in order to test with.

He is located in this area, and would be able to hit someone in the Philadelphia, PA, Baltimore, MD eastern MD and lower New Jersey area. Apparently (I'm not versed very well on this stuff -- forgive me) they run on 2 meters on 146.65 Meg.

Any contacts would be appreciated.

>radio was just starting up. In the environmental spirit of things,
>I'd like to recycle the unit and continue to use it with a more
>modern networking system (e.g., the KA9Q NOS package).

Look for tnc_ash.arc as part of the 890421.1 distribution of the KA9Q code.
All that you're looking for is there, with sources. If you can't find it
anywhere else, try col.hp.com, as ~ftp/ka9q/890421.1/tnc_ash.arc.

You're welcome!

This is *not* the same thing as the HAPN board, which is supported by an
internal driver in NET/NOS.

To: ALL

HI! I am very happy to see Peter's note translated by Don Moe. I have had a storm of letters, notes, etc. requesting further information, wondering why we decided to do this and that, etc. He brought out many details that I had forgotten about, I am extremely grateful he did this. It is perhaps not completely clear from Peter's extremely detailed report that ALL THE ITEMS HE METIONED ARE STUDY ITEMS. They are on the `action item list' for the experimenters and in each case it is said `study' or `investigate'. I take as an example:
N4HY wants to INVESTIGATE the possibility of P-III-D carrying a high speed hard limiting digitaltransponder with L band up and S band down. The highest possible speed above 64 Kbps and up to 1.55 Mbps should be considered.
This I have done or am doing. I am proud to say I have achieved getting the aid of some very good microwave nuts and I hope son to enlist other aid in getting digital types and microwave types to work with us on a DESIGN experiment.
In no case has AMSAT-NA, AMSAT-DL, or AMSAT-SA or anyone else cast ANYTHING into concrete except that we have an action item list of things to study and that we will meet again next spring or early summer at a place yet to be determined. You have plenty of time to comment, put your own thoughts into the process, contribte to the study items, etc. At this fall's AMSAT-NA annual meeting, the newly constituted board of directors will take up III-D as a future project and vote at that time whether or not to commit to it.
I suggest if you like what is implied in Peter's extemely nice report, you write to your directors and show your support. If you are opposed then of course do the same. We are your elected representatives and we want a new project to lead AMSAT into the future. I believe this is the one we should do butI do believe we need to hear from you.   73, Bob

>1) Digis are also much simpler to build and operate than full-duplex
>radio repeaters, since you don't have to keep the transmitter out of the
>receiver.

It's interesting, though, that when you get interested in using a repeater instead of a digipeater, it's a lot easier to enlist help from an existing repeater organization, often accompanied by bits and pieces of hardware becoming available that you couldn't find otherwise... and if you can convince a repeater club that a digital repeater is a neat way to one-up the other club in town... :-) We may actually have a digital repeater in the Springs soon as a result of this approach...

>2) FLAME ON:
>"Nobody has the balls" to start repeater wars, huh? Damned right! We've
>outgrown that stage. Plopping a radio on an occupied frequency is simply
>bad practice.

Don't disagree with you at all. But, I'd like to add my voice to those of the others who have spoken on this subject, including Phil and Brian, to complain about the attitude I personally have run into that digital devices "don't belong on repeater frequencies", and that "all the frequencies are in use so don't bother asking". It *is* tiresome continually dealing with a class of individual that believes the only useful amateur mode is FM voice.

Fortunately, I've found some locals in a position to help who are tolerant of "the cause". But, it's taken me 4 years of almost constant effort...

This is preaching to the converted, I realize. If nothing else, know that it *is* possible to make things happen if you try hard enough!

What we are all using here in Arizona and New Mexico, is something that
sounds similar to the Compuserve method. Instead of just the lower
16 bits though, we convert the lower 24 bits to hex and just use that
as the NETROM node ID. I don't see any good reason to include the "#"
in the node ID. In fact, with some versions of "The Net", IDs that
begin with a "#", don't get rebroadcast. Some people here were using
IDs with the "#" and couldn't figure out why they had such a high
quality at a node, but weren't being passed on to the next one. Once
they simply dropped the "#", everything worked as expected.

The string of HEX digits as an ID is certainly unique. You can then
"pick out" the TCP/IP nodes at a glance, instead of having to search
for "IP" or "TCP" burried in the sea of alphabet soup. It also allows
someone else that has spotted your ID on the air, to go ahead and add
the IP address to their "domain" table, or hosts.net file.

>Jay Maynard, EMT-P, K5ZC, PP-ASEL | Never ascribe to malice that which can

Jay,

 I have been the victim of flagrant prejudiced against packet
radio use of FM channels.. I have a valid coordination of a
repeater pair in two meters.. it had been on the air as a packet repeater
for a year.. I didn't disclose
the operating mode to the coordinator (none of his business, actually
as long as I operate it as a repeater and USE both frequencies)..
To him RTTY was OK
but packet wasn't.. He (incidentally to our packet use of the pair)
drew up a 20 kHz plan for the
146 mHz sub-band and wrote our club repeater out of
existance saying, quote:

"Oh, 146.73?.. you guys are packet and belong in the the 145.0X band anyway..
You'll have to move!!!"

Lucky for our packet club, he was ousted and a new organization was installed
(for various reasons).. which ended the problem..

I agree one should work within the system, but I and others had to do quite a

bit of "missionary work" with our repeater council to get a favorable
climate for packet repeater operators to compete for spectrum on a
fair and equitable basis with voice (and even RTTY) users...

I agree with what the overall idea of your message.. Fair Coordination
is the only way to fly.. But I have suffered under two coordinators who
were predujiced against packet and tried to do something about it
so unfortunately the PEOPLE in a number of locations are a problem..
not necessarily the system of coordination.. I believe that is what
Fred was referring to.... I for one am NOT "tired" of discussing
problems that we face as packet repeated trustees...

I don't think your threat about a pink ticket was unnecessary, Jay..
I've heard that before from a coordinator.

I doubt that many people
in this day and age disagree with a Fair Coordination system..
I just wish that we didn't have "voice" repeater coordinators that are
prejudiced against packet and other "non-voice modes" of communications..

Hi All:

I need two things:

A machine that contains executables for ka9q for Xenix386/Amiga/PC
and that is pc pursuitable. I may be able to have it ftp'ed to
my account here at pnet01 if I can figure out how to ftp etc.

Also ...are the sources available for it on these machines?

Also ...is the TCP/IP code that it uses usable in any tcp/ip
situation or only for packet radio?

Respectfully,
Jim Burnes

I've put together a full-duplex two meter packet repeater that
regenerates the FSK tones by the simple expedient of hooking a TNC's
demodulator to its modulator. That works really well for 1200 bps
but for all practical purposes, is limited to that speed.

I'd like to encourage the growth of other speeds, primarily 9600 bps,
and I think having the repeater capable of that speed would be a boost.
I don't want to put up a repeater that is 9600 bps only, because it
would receive little use and simplex 1200 bps would probably continue to
occupy its input and outputs.

I've come up with two schemes for multi-speeding the repeater:

1) have another modulator/demodulator hooked in, such as a hacked K9NG
or G3RUH modem, and OR the 1200 and 9600 bps DCDs into PTT, and use each
one to gate the audio from the respective modulator into the transmitter.

2) simply make the audio passband between receiver and transmitter flat
and linear over 30Hz to 15kHz or thereabouts, so that it would be
able to repeat either the AFSK 1200 bps stuff OR the direct-FSK output
from the K9NG modems. I'm not sure what I'd do to key the transmitter
- a simple noise squelch is out because I don't want people talking
through the thing.

I can do either, I think. The receiver is that wide, and the
transmitter is a direct-FM widget, so it ought to be possible to do #2,
which I'm leaning towards because it's cheaper.

Suggestions? Anyone tried anything like this?
     - Brian

With all this searching for a full duplex packet repeater, why hasn't
anyone tried running a linear translator yet?? You know, like the
headend on a broadband LAN (any Localnet 20 people out there?)
I would think that with all the experimenting done by AMSAT, we
should be able to put together something reasonable.

Any comments??

Case history - A certain station trying to connect to the local
DX cluster shows up on a repeater input in Monterey. The guys
in Monterey can't hear him on the input but the repeater sure can.
(The offending station was 50 miles north-east in San Jose....)
Finally one enterprising individual manages to hear the offender
(changes the call on his packet station...humphhh... we won't
talk about that part of it ;-) and allows the offending station
to connect to him. Thats it...problem solved. Note that about
a week latter the same station started showing up on the input
to our main emergency repeater several days in a row. This guy
seemed to make a habit of screwing up. I'm pretty sure he
wasn't doing it to cause grief, he just made an operating error
that caused problems(several times). This is just one of the
stories that repeater trustees will tell you that cause them
to "cop an attitude."

This just goes to prove that there are ALWAYS two sides to a
story. The repeater operators get PO'ed at packet stations showing up
on their repeater inputs. Now this usually happens as an accident but
chances are pretty good that the trustee doesn't have a means to figure
out who the offender is, and thus there is no way for the trustee to
contact the offender and ask him to move. After all the packeteer
is operating blind...probably wondering why nobody is connecting
to him while he forgot to switch the rig to simplex. End result is
an "attitude" on the part of the repeater owners/trustees.

The major difference that I see between the new MFJ Multi-Com Multimode
controller and the
AEA PK232 is MFJ's ability to receive/transmit pictures with mult-levels
of gray.   Is there a way
of making the PK232 support these improved images ? I asked a rep at
AEA and they said that it
was a shortcoming of their modem. If it's the modem, could you use
MFJ's new modem with an
existing PK232 ?

Thanks,

Lee Stogner, N4XBD

Or worse, that the only useful repeaters are the ones that have always been
there, or that unused machines have priority over new ones that would get
used just because the unused one got its coordination first.

> This is preaching to the converted, I realize. If nothing else, know that it
> *is* possible to make things happen if you try hard enough!

One must of course try. And in my case, not all the possibilities have been
exhausted yet, so I will continue to try (and my cause is not for digital
repeaters.... yet).

All modes and kinds of operation on the ham bands deserve equal and fair
access to the spectrum. Seniority of an operation mode has some place, but
not to the excess that certain people might want.

This is one of the reasons that FM coordinators should be out of the spectrum planning business.

It would not be wrong for ONE organization to fill both roles, but the input to at least the spectrum planning role must be equal and open to all. This means voting membership cannot be limited to any certain subgroup on any basis (except maybe hams who never use the radio spectrum).

> Lucky for our packet club, he was ousted and a new organization was installed

ATV'ers are also subject to similar abuses. ATV is certainly a difficult situation. The problem involves both the spectrum planning aspect (where FM repeater owners are trying to force all ATV use to 23cm and up) to actual repeater coordination problems (there already is an ATV repeater within 200 miles of you, so you cannot have one [ATV'ers are good at sharing spectrum and ATV usage patterns allow it much more than FM]).

> problems that we face as packet repeated trustees...

It is good that we try to get the problems solved this way. But there are some people in the FM repeater circles that ar just trying to force people into doing things like creating a "packet repeater coordination group" that coordinates packet repeaters and refuses to coordinate FM voice ones.

Hey, we COULD copy their nasty attitude problems back at them, but alas we are more civilized and will seek solutions instead.

> I don't think your threat about a pink ticket was unnecessary, Jay..
> I've heard that before from a coordinator.

The pink tickets also don't come as often as people might like to think. I don't know yet if this is good or bad, but it waters down the threats (which is a bad aspect of pink tickets).

> I doubt that many people
> in this day and age disagree with a Fair Coordination system..

Perhaps we need to do some spectrum planning for digital repeaters? Maybe. It is perfectly possible for a digital repeater to be geographically separate from a voice repeater on the same frequency, and everything work (until maybe the band opens) fine. It would not be necessary for one bunch of repeater pairs to be assigned to packet repeaters and anther to voice repeaters any more than is done now with RTTY. In fact we have one repeater here in town that is used for all three modes. But what this requires is that those who do the coordination to do things in a fair and equitable manner. Unfortunately it is a big vague as to what "fair" really is, so the repeater coordination group that oversees such things should have equal and fair representation of all groups that it needs to serve (or just all hams would be simpler).

If the incoming signal is just barely copyable, the linear translator will not be making any improvements. An FM audio repeater would do some. Ideally, a repeater should do bit-by-bit demodulation and remodulation so that if the edges are marginal coming in, they are good again going out.

Someone recently mentioned that the MAXFRAME parameter should always be
set to 1. Why? On user links and backbone links? What if your link
is a backbone link ("solid") and you want to send more than 256 bytes/shot?
It's still not a good idea since you will still have some collisions?

When tcp/ip (ka9q package) backs off due to channel congestion, does it
wait longer between frames, reduce frame size, both, or what?

(First paragraph refers to Net/ROM links.)

I don't have any idea if they are PC Pursuit'able, but there are two systems
I know about you can check. N8EMR and WB3FFV both have BBS systems.

>Also ...are the sources available for it on these machines?

Yes.

>Also ...is the TCP/IP code that it uses usable in any tcp/ip
>situation or only for packet radio?

It's a full implementation of the protocols, with support for a variety of
interfaces including ethernet, and so forth. Not sure how much works on
Xenix, but know the PC and Amiga versions are flexible.

I have the WB3FFV info handy...

The latest Doc from Jeff Ward and Harold Price on the Packet Broadcast Protocol is available on the WB6YMH BBS.

The phone number is: (213) 451-2503

The file is called: PACDOC.ARC
The file is on the A0 drive

I believe this package is also on COMPUSCURVY.

This stuff which will be published in the next issue of the "ARRL Computer Networking Conference" proceedings.

If none of the above meets your needs you can get it via the USMAIL.LAN. Just do the following:

Self Addressed Stamped Disc Mailer
360K 5 1/4 MS-DOS Formatted disc
A note saying what you want

I will then mail you a copy of the above.

Send the mailer to:

Julian Macassey, N6ARE
742 1/2 North Hayworth Avenue
Hollywood
California 90046-7142

Well there are tradeoffs involved. With the terrain we have around here,
most signals to the repeater sites are solid full quieting. The reason
we need repeaters at all is that many stations have very limited simplex
range due to the rolling terrain. In this case a translator is a win
as a simple coverage extender with nice strong signals that don't need
regeneration. Doing regeneration makes sense with weak signals as you
point out, but you then have to solve the problem of multiple modulation
systems. If you wish to support mixed speeds, and finanical and spectrum
considerations make this a must in our area, you must have multiple
decoders and encoders and solve the collision problem. Each modulation
scheme responds to different detection methods. A 1200 baud modem will
not recognize a 9600 baud modem and so on. This is a killer in any
mixed system, but with the translator the problem is not at the
repeater site. Only the users need worry about it. With a regenerating
repeater, both the repeater and the users have to worry about collisions.

Remember that a user monitoring the repeater output will transmit unless he detects a valid data carrier of his modulation type on the output. One viable way to solve this is to have the repeater send a CTSS type tone (busy tone) at all times that it is receiving a valid packet. The user can then use a tone decoder to drive his external DCD. This scheme holds off users of different modulation methods from clobbering each other. This scheme works with the translator too if each user transmits the CTSS tone. This is a very good idea for a multispeed repeater as well since it makes PTT easy. The major drawback of this method is that most commercial CTSS decoders are slow.

I'm very interested to see the followup to this, Brian. We're thinking of doing the same thing ourselves, for a high-speed UHF link. There, the idea was simply to keep the cost down, not to provide multi-speed pass through. As cheap as 1200 baud modems are, you could probably put one in line and use only the dcd from it to key the transmitter. I don't know if it would be possible to kludge a simple dcd that would respond to the 9600 baud signal. If you find out that it is, please let me know!!!

I was wondering what happens when packet becomes common running 56kbaud with
routing. Isn't it possible to use routing programs available for Internet at
that time (i.e. dynamic routing)? Shouldn't we use AX25 as a transport layer
to the nearest possible access-point for a backbone?
The reason why I'm wondering is that at the moment the NETROM configuration
doesn't work in Europe (to be more specific: in Holland & Belgium) because
of bad cooperation. For instance a lot of people over here use #TCPIP as
their netrom routing "nick" but in Belgium they use other names. If
routing takes place at the TCP/IP level we won't have any troubles with this
anymore...
What do you think? (Dynamical routing especially on such a scale as used
in amateur radio where links drop out from time to time might be a very
interesting subject for experiments!)
Please let me know...

I made an observation with my Pac-Comm 9600 baud modem which has left me a little bothered. It may also be the cause of some strange problems which I have seen.

Using the modem as a standard TNC and turning MONITOR ON and PASSALL ON, the terminal starts printing out random data. I figured that the SIO chip would not receive data unless the DCD line was asserted. Pac Comm says that the DCD line is used to determine when to send a packet and not used to determine when the serial data is valid.

On the Pac-Comm modem, the RX Data line and RX Clock line are always sending signals to the TNC, even when the PLL is not locked. This seems to be the reason for the TNC to be seeing data even when the PLL is not locked.

This design bothers me. I have noticed garbage calls showing up in my MHEARD and I have also noticed times when I have problems communicating with the other 9600 baud station (it is set up the same way).

What I want to do is qualify the RX Data line with DCD or Lock Detect (same signal). This way, I will be sending all zeros until the PLL is locked. It bothers me that I would need to do this and thought I'd ask around before getting too carried away.

Is this the same observation that others have made? There is a status word in the Pac-Com TNC program which counts the number of bad frames the TNC has received (don't remember the name here at work). I looked at this number and it was about 30000. I looked again about one minute later and it was about 200 higher. The firmware I am running in the TNC is TINY-2 PMS 2.3. We would like set this equipment up as a digipeater between Pendelton OR. and here in Boise ID. But I want it working a little better than this (maybe TheNet and/or NetRom firmware will not have this problem).

I would welcome suggestions as to how to address this problem. Winter is comming and I always seem to put my mountain top projects off until October for some reason.

Thanks, Steve King KD7RO

I'm having a problem halting a scroll during a telnet session on the Mac using NET.
More correctly, I'm unable to RESTORE a scrolling display after halting it with a cntr-S. Normally I assume that cntr-Q would resume the scroll after I've had a chance
to catch up. The problem on the Mac is, cntr-Q causes the program to QUIT!
Is there any way to disable this? Can I issue a command to the Unix machine I'm telneted into that will remap cntr-Q to another set of key?

TCP/IP NETROM ID's in North East Ohio come in two flavors

1) XXXIP
2) The HEX abbreviation

-SSID's for TCP/IP are generally -4.

>miles of you, so you cannot have one [ATV'ers are good at sharing spectrum
>and ATV usage patterns allow it much more than FM]).

While I am not an ATV hater, I do not feel that ATV is quite the same.
FDX packet would be the same bandwidth as the voice channels. (kd4nc's
situation.)

ATV is looking at 12 Mhz of occupied space, if I remember correctly.
(correct me as neccessary, it is still *real* wide) at 25khz spacing, 240
voice repeater channels for the 6Mhz output.

I feel ATV has a place, and I don't mind sharing 440 with ATV. I *do*
feel strongly that a 440/900 or 440/12xx plan would make alot of sense.
It also makes things technically much easier. (Think about a duplexer)
One reason that you hear 56k packet types discussing split band repeaters.

Otherwise, the 2 available ATV 440 pairs use an inordinate percentage of
the spectrum. (dozens of 56k packet channels :->)

BTW, the same coord that gave kd4nc such a problem did not coordinate
FM rptrs below 444.00 because the local ATV rptr monger ran non standard
pairs, so you could use a CATV ready TV to receive it. He would bring it
up every six months or so, to retain his freq. This ham had multiple offers to
put the ATV rptr on a much higher site, if he would move to a bandplan
pair. He refused. He now grumbles about the voice rptrs in 443.0+ and
talks about lack of interest in ATV.

There is also the problem of poor ATV RF design. Proper filtering of
both TX & RX will allow coexistence with FM rptr 440Mhx and up.
(for one pair, I believe) However, only one of the manufacturers
of ATV gear at Dayton build them that way. They are not the
cheapest, nor the "big name". Users of the cheaper stuff walk into
a built in problem when they buy it, and 440 is in use in their area.

I think ATV could be really neat, but if I ever put one up, it will
be higher than 440!

There are a lot of ATV'ers still operating that way. Many are narrowing
down their spectrum. The ARRL national bandplan uses 6 Mhz wide channels.

> I feel ATV has a place, and I don't mind sharing 440 with ATV. I *do*

It does make sense and these things are being considered.

> Otherwise, the 2 available ATV 440 pairs use an inordinate percentage of
> the spectrum. (dozens of 56k packet channels :->)

There are 3, but even *I* think 3 is too many for ATV on 70cm. I base my
statement on the national ARRL bandplan.

> BTW, the same coord that gave kd4nc such a problem did not coordinate

> talks about lack of interest in ATV.

The ARRL national bandplan has ATV in 438-444 Mhz and FM repeaters in 442-445
Mhz. All the ARRL TV channels already match up with cable ready tuners. He
could choose to use one of the other 70cm channels and still be aligned with
cable ready tuners.

> There is also the problem of poor ATV RF design. Proper filtering of

I'd call AEA a "big name".

The problem is tricky. It requires very linear circuitry to maintain the
vestigial sideband, or a good filter after the final amplifier, or both.
It does cost money, but it is money you need to spend.

As to the guy operating the ATV repeater up to 444. His carrier is probably
on 439.25 Mhz. Check to see if his signal covers the 435-438 Mhz satellite
band where the FCC rules PROHIBIT REPEATER OPERATION. Now you have something
in your arsenal?

> I think ATV could be really neat, but if I ever put one up, it will
> be higher than 440!

If I do a repeater it would be on the higher bands. But I would be using 70cm for ATV DXing because that is where everyone is. Remember, "low bands are for DX-ers" :-)

Now back to packet.....

Hello Doug Yuill,

Which version of MacNET (or NET/Mac) do you use? Are you running NET on a 512K or a Plus?

Usually Command-Q (not control-Q) is QUIT, but I think on a 512K or Plus the Command-key is interpreted as the control-key, am I right?

Maybe not the Command-key, but the Option-key should be the control-key just to avoid these situations.

Meanwhile the latest version of NET/Mac is version 2.0, released some time in april 1990. It can be downloaded from Apple.com and MacScience BBS.

I have made a number of fixes to NET/Mac. These fixes will probably be included in the next release. Telnet is one of the things I have just started looking at, so maybe I can try to solve your problem right away. Please give me as many details as possible.

By the way, if you want my latest version, please let me know and I'll e-mail it to you.

I'm am interested in doing some research on currently available radio
modem protocols.  What I'd like is information on what protocols have
been developed, and a detailed explaination of their capabilities.

Any references would also be helpful.

Thanks in advance.

--
Sincerely,

Mark Pledger

Would the following idea be possible, sensible, legal, practical?

A system for distributing UUCP newsgroups:

Use an AM radio station (or an FM SCA or TV SAP channel) to broadcast and distribute newsgroups late at night. Connect a modem to a master computer at the radio station. Drive the transmitter's modulator with the modem. Obviously, the modem's protocol needs to be single direction, it can't expect to hear any replies. People at home would have their PC's connected to modems which are in turn connected to appropriate radio receivers. The PCs would run appropriate software that would listen for, and store articles from user preselected newsgroups on hard disk. The user would use a conventional phone modem to call a central number to post articles, send e-mail, etc. Probably receive e-mail via phone, or would it make sense to deliver e-mail via the radio station (this assumes that the sender (and receiver) isn't too concerned about easedroppers. Normally, the system wouldn't let it be seen by others, but some hacker might defeat that). Idea being that most users read a lot more articles than they write, and you could distribute articles to a lot of users quicker than tying up phone lines and computers doing one-on-one one at a time.

What speed should the baud rate be? 4800? 9600? And have some form of error correction that doesn't depend on any feedback.

How to pay for it?
Subscription fees? But some hacker will figure a way to pirate the system. Maybe, make it free to receivers, and insert short commercials at the end of every article? Like: Enjoy Coca Cola! Get your next printer from "Joe's

Computer Shop" at 5th and Main.

If this makes any sense at all, maybe it would give owners of AM stations without listeners something to do. Or is there an FCC rule that says that the broadcasts must be directly human intelligible?

"This Bud's for you!" -- Budweiser Beer (example of a short commercial)

I have some experience with tnc-2's. I often find the PLL feeds random garbage into the SIO chip, particularly those designs that use an MF10 filter. But the chip should ignore random input, until it receives a SYN char (or several?) So I don't think this behaviour is in itself the problem.

I hope soon to install several 9600 baud modems (g3ruh design, from PacComm) and I'll see if I can duplicate the problem.

The North East Digital Association will have it's 4th board of directors
meeting on Sunday Sept 30 1990 in Albany NY.

This meeting is held quarterly in rotating cities throughout the area
of coverage of the club managed network. The previous meetings were
in Albany NY, Concord NH and Rochester NY.

This meeting is to be held at the Tom Sawyer Motor Lodge on Rt 20 in
Albany. This meeting is in place of one that was originally scheduled for
Sept 23rd in Poughkeepsie. The Sept 23rd meeting was canceled as the
host (N2CJ) was hospitalized due to a health problem.

If you are planning in going to this meeting you must RSVP to WA2WNI @ WA2WNI
or phone WA2WNI, Dana, at 518-784-5482.
The meeting is open to Voting members of NEDA.   Membership may be applied for
or renewed at this meeting as well.

The North East Digital Association was formed in fall of 1989 to maintain and
document a TheNET & NET/ROM based packet network. The network currently has
36 sites and spans Buffalo NY to the New Hampshire seacoast. All of the
network sites are privately or club (other than NEDA) owned and maintained.
All network sites support multiple radios/ports and are linked using
dedicated HTS free circuits, all inter-site linking being on 440/220/1200 or

50mhz.

Membership is $15 for support and $25 for voting membership
(Voting membership is invited to board meetings)
The 6 board members are elected at the fall general meeting which is
open to all. Board members are nominated from all voting members
who have attended 2 of the 4 preceding board meetings.
Minutes of each board meeting are published in the following NEDA Quarterly.

For more information on the club you may email me at torbortc@clutx.clarkson.edu
or USmail to NEDA Box 563 Manchester NH 03105
The packet mail address for the club is NEDA @ W1NY.

>Please let me know...

Yes. Folks have played around with using RIP as a routing protocol for TCP/IP
on packet, and it works just as well/badly over the air as it does elsewhere.
Anders Klemets has writting an initial implementation of Fred Goldstein's
RSPF routing algorithm, and the G1EMM version of NOS includes this. There are
still some problems, probably both with the protocol and the implementation,
but it's the right direction, I believe.

I assume you mean the DCD mods. The prices are all in the $11-$20 range,
there are different models for different modems/TNC's.

Call TAPR for more details.

For those of you who have been looking for 220 MHz transverters to use
with the WA4DSY modem, Sinclair Radio Labs (Sinclabs) has begun production
of both 144 MHz and 220 MHz models (but not 432 MHz) with 28 MHz IF.
I recently purchased one through East Coast Amateur Radio, but they
may be available elsewhere.

Relevant addresses:

  Sinclabs, Inc.

Specialty Products Division
85 Mary Street
Aurora, Ontario
L4G 3G9

East Coast Amateur Radio, Inc.
496 McConkey Drive
Tonawanda, NY 14150
(716) 835-8530 (after 1PM EDT)

I have not used the transverter with the DSY modem yet, so have no information on how well it works as compared with Microwave Modules or other units.

Awhile ago I was in a radio store and I was reading through a magazine. I came accross a neat article, but I ended up not buying the magazine and then forgetting about the article. Now I find that this article might be very useful to me. Murphy's law... Anyways if you recognize the article that I am about to describe then please E-mail me. I would like to know the name of the magazine and the issue date. I would also be willing to pay for you to send a photo-copy to me.

The article described how to build a cheap video frame grabber for the Commodore 64 computer. The author was using the video digitizer as a sort of cheap slow scan TV system by transmitting the bit map via packet radio. I thought that the quality was rather poor, but the entire circuit was very simple and inexpensive. The article included a grainy picture of the author

in his ham shack. I think info was included for ordering kits and PC boards. The surprising thing was that I have seen audio digitizers that looked more complicated than this video digitzer.

I am pretty sure that the magazine was Ham Radio, but I can't be certain. The issue date was late 1988 or early 1989. The local library does not have this magazine (or any other radio magazines).

If you can help, Thanks.

Assuming a typical K9NG modem running at 9600 bps and set to +/- 3 KHz deviation, what sort of channel bandwidth is it going to occupy? I've heard figures ranging from 16 to 20 KHz at the -60db points. Any solid numbers from actual measurements?

Also, what is LOWEST frequency to be expected? Since there is a 17-bit "scrambler" (pseudo-randomizer) in the modem, and there are limits to the bit patterns that can occur in valid HDLC AX.25 frames, I would guess that there is a calculable lowest modulation frequency that would represent the coincidence of the worst-case transmitted bit pattern with the scrambler pattern. I've not seen any published info on that.

(Yes, it could be zero, if the bit pattern and scrambler pattern matched exactly. However, I believe the scrambler polynomial was chosen to avoid that occurance. Unfortunately, the info I have here isn't specific enough to answer that question.)

Comments?

Hi.

    When I use the local mini-convers node, (net/rom connected through
a neighbor node with NOS), some ass always insists on sending me 100 BELLs
in a row the instant I walk out of the room. Each bell seems to be around
500ms, but they are NOT interrupt driven bells, and so a string of 120 bells
would TOTALLY IMMOBILIZE my computer for 60 seconds, etc.

    Anybody got a quick fix for this (other than shooting these idiots) ?

                                Chris/WZ2B

Nope. I have no idea what Stargate is about, but the CACM article indicates
that the objective was the development of a "community" resource system.
USENET distribution was only a small part of the project. Other items,
e.g. financial tickers, etc., were used more than USENET was. Kind of
an "over the air Prodigy" project.

Could someone who is knowledgeable about such things do a comparative review of transverters in the context of being used for packet radio. I would not need to see an "experiences" review, but one of "specs analysis" by someone who knows the stuff better than I, would be useful.

I am also interested in the suitability of combining transverters to get up on the higher UHF and SHF bands from the 28 Mhz IF of the WA4DSY/Grapes modems. For instance a lot of these transverters will have IF at 144 or 432, so it would be necessary to combine a couple of them in these cases. Those that work direct from 28 Mhz should be pointed out, though.

I am concerned about things like front-end overload from in band and out of band signals, and just how narrow the IF strip is or should be, or if that really matters much. Potentially I might be putting, say, a system like this up on a tower with a UHF voice FM repeater just a couple MHz away.

56K baud or higher, if you can get the bandwidth.

Definitely forward error correction methods are a must.

> How to pay for it?

> broadcasts must be directly human intelligible?

Alternatively, make it a satellite based service. One satellite transponder
should handle the load easily. Then it can be picked up all over the country
for local redistribution and reduce some network traffic. And the local AM
and FM+SCA stations that carry it can get it that way as well.

Maybe we need to petition the FCC to create a service called "Digital
Broadcasting".

How about letting the full bandwith of the connection be used by TCP/IP

and run the voice grade as an application over that?

I can't quite follow what you are talking about, but I think you will
run into some technical problems, and once you solve them you will have
re-invented the modem. A "modem" is a (MO)dulator-(DEM)odulator. You
do have to "modulate" even if it is simple ON-OFF digital.

Hello all

Does anybody have any experience on GRAPES modems connected to a Mac?

If so:

1) Can we connect this moden to one of the serialports or
2) Do we need extra hardware (software)

Any reply will be appreciated.

Last I knew, the Cambridge Ring used a central control station to
regenerate the token if it got lost. Is there now a new version which
does not require this? if so, can someone point me to a reference?

On most of the PC/XT/AT and clones, the parallel printer port data lines
are driven by a tri-state latch or driver that has its output enable
nailed on. There is also an input port attached to these lines to
enable the self-test to read back the data when doing a looparound test.

If you drive the pins hard enough, you'll overcome the output drive of
the latch in the adaptor board, and you'll be able to read the data
you've shoved into the adapator. This is a bad idea, since it will
definitely shorten the life of both the adaptor's output latch and
whatever it is you're attaching's output latch.

A simple way to make the port bidirectional is to cut the trace going to
the output latch's output enable, and run it out to one of the
otherwise-unused pins on the blue-ribbon connector. If you do it
through an unused inverter and add a pullup resistor, it will default to
the normal mode, and you need only pull the line down when you want the
PC to be able to read from the port.

Some Taiwan-Tailgate parallel adaptor boards have a jumper to do just
that, or may already be wired that way.

The commercial i/o-on-the-parallel-port widgets I've seen DO use just
the handshaking and status lines, since you can't depend on the
bidirectional capability of the data lines being present.

Please read what I wrote. The question is not whether you need a central
site -- of course you don't -- but whether you can meet *guaranteed response

times* with a decentralized recovery algorithm. Real-time ones, I mean.
Last I heard, the worst-case delay in an 802.5 system was a fair fraction
of a second in certain cases of token loss.

>conclusion.

    I should point out that I was surprised also. I suspect the
presence of the 'equalizer' filter in the TNC-2 probably does a lot
to help. On the other hand, the researcher probably picked up the
XR-2211 data sheet and used the manufacturer's recommended circuit,
and picked up the Am7910 data sheet and used the manufacturer's
recommended circuit. This, from a research point of view, is valid,
though not terribly useful in the packet context where most folks
are using the TNC-2 circuit. What would have been most useful in
the original paper by LU4DXT would have been to include the
specific circuit he used in his tests; I recall noting the
absence.

   I'd be interested in the results of comparing the TNC-2 demodulator
with a 'standard' XR-2211 demodulator. Furthermore, I'd be interested
in comparing an Am7910 with and without the internal equalizer filter
enabled.

  Of course, as soon as DSP based modems become cost competitive in
packet radio, this is all moot... 1/2 :-), since I think the DSP
concept is excellent but the cost is a prohibitive factor... Maybe
what we really need is a $75-$125 do-it-all modem based on a DSP.. :-)

Far, far too much. The only case where I was able to dependably
make reading from the parallel adapter work was on a PS/2. The
original monochrome display/printer adapter would work 50-60% of
the time -- it depended on the card -- and most of the clones
I had access to (no-name Asian make) didn't bother worrying about
what would happen if someone tried to input from the parallel
printer port -- they designed it to published IBM spec, which
only does output.

(if anyone cares, the project was to monitor some 1-bit sensors
surgically embedded in a bunch of sea anemones to see how muscle
contractions work in invertebrates. It was kind of a silly study,
but it had some cool gadgetry involved...)

>Do printer ports on other machines work bidirectionally?

Many machines have bidirectional parallel ports -- warm fuzzies
to you guys at HP for putting one on darn near everything you
make -- but not all "printer" ports are bidirectional. Like
everything else, it's a question of design. Well-designed I/O
ports work both ways, and the others .... 8-(.

I have seen several postings about using the printer port for general purpose I/O, or more likely for directly driving an RF modem (Which I, too, am considering as a way to make a cheap packet setup for the PC similar to the Digi-com for the Comodore), but since I have not read them all, this may have been covered already. Indeed, I hoped it would be covered, which is why I did not take the time to read all the postings. Nonetheless, after seeing the subject reappear every time I scanned the newsgroup for weeks, I decided to read the postings to make sure my computer was not broken :-). At any rate I apologize for the wanton use of bandwidth if this has already been covered.

Anyway the gist of what I am driving at is this: You can use the parallel port for anything if you forget about the grouping of signals as they are used by a printer and just think about them as a collection of inputs and outputs. More specifically, 12 outputs and 5 inputs. This is done commercially by software such as Laplink and Fastwire, and I have used it to provide a high speed communications link between a PC and a single board computer. Also, Latice Semiconductor uses this technique for programming their line of In Circuit Programmable (ISP) GALs.

At this point I assume that you all have enough information about the parallel port that you can figure it out yourselves. If this is not the case, I will be glad to pull the stuff out of my files and type it in so I can E-Mail it to any interested.

Sb: PK-232 MOD; HEARS BETTER

FOLLOWING INFORMATION RECEIVED FROM WOLF ZS6KE:
CONCERNING A MOD TO ELIMINATE NOISE FROM THE OP-AMPS.

ON RECOMMENDATION OF OM PIET, ZS6AQC I CHECKED THE NOISE ON THE
POWER BUS TO THE MC34074P OP-AMPS AND FOUND (JUST LIKE HE SAID) THAT
THERE IS A LOT OF RUBBISH BETWEEN THE PINS 4 AND 11 OF U23, 26, 28,
30, 32 AND 34. SO I PLACED SOME 1UF CAP'S ACROSS THEM AND MY
RECEIVE NOISE (MEASURED ON A MARK-SPACE SCOPE CROSS-DISPLAY) IS MUCH
MUCH LESS. IN FACT, I CAN NOW EVEN COPY SOME STEADY SIGNALS THAT
DON'T EVEN RAISE THE S-METER NEEDLE. HOPE YOU CAN IMPROVE YOURS
ALSO?

THIS WAS RECEIVED FROM OD5NG: HE MADE THIS MOD AND RESULTS WERE
OUTSTANDING.

THEN CLARK, W9CD MADE THE MODIFICATION AND WAS PLEASED WITH THE RESULTS.

CONSEQUENTLY I BOUGHT FROM RADIO SHACK 6 EACH 1 MF TANTALIUM CAPACITORS
AND MOUNTED THEM ON THE BOTTOM OF THE BOARD, WITH THE SHORTEST POSIBLE
LEADS IN THE POSITIONS DESCRIBED ABOVE. THE RESULTS ARE OUTSTANDING.
RTTY SIGNALS I COULD NOT COPY BEFORE NOW COPY PERFECT, EVEN WHEN YOU
CAN BARELY SEE THE TRACES ON THE SCOPE. ARQ LINKS WHICH COULD NOT BE
MADE BEFORE NOW FLOW SMOOTH.

THE POSTIVE SIDE OF THE TANTALIUM CAP GOES TO PIN 4 OF THE SIX MC34074P
ICS AND THE NEGATIVE SIDE TO PIN 11.

GIVE IT A TRY AND YOU WILL BE PLEASANTLY SURPRISED.
73 AND GL DE JOHN, TG9VT

Adam van Gaalen asks:
"Does anybody have any experience on GRAPES modems connected to a Mac?"

I have been using a Grapes modem with my Mac for about a year now and happy to report VERY good results!
On the software side I am running KA9Q's NET for the Mac which supports separate windows for all your sessions, very nice when you want to run with trace on. I use a 10 meter long cable to connect to a Pac-Comm tiny-2 TNC running KISS-56. I use the modem port at a data rate of 57.6k baud.
I had to REALLY soup-up the tnc to get this data rate. The maximum rate supported by the tnc on the terminal port was 19.2k baud, I surmised that by tripling the master clock, I could achieve the desired 57.6k baud. This worked ok. I did however have to jumper the tnc for 1/2 speed operation of the Z-80 cpu, aprox. 7.5Mhz. I believe that Pac-Comm no longer provides a half speed jumper in which case you would require a flip-flop to divide the clock down. It was also necessary to replace the SIO with a 6Mhz part.
I razored the traces used for the ttl level terminal port connector on the tnc and used that connector for interfacing the WA4DSY modem.
Right now I'm using a Hamtronics 28Mhz>220Mhz 1 watt xmit converter with a 1/2 wave ant. to access the input of our cross band repeater. On the receive side I'm using a Microwave modules 70cm> 28Mhz converter. The DSY modem seems to false a lot, ie: the carrier detect is always coming on in the presence of intermod. I installed a bandpass cavity filter on the input of the receive converter to cure that problem.
Performance wise I'm getting about 2k bytes/sec during ftp's. This figure would be higher except the tnc runs in stop and wait mode, ie: it can not be sending a frame to the Mac at the same time as it is receiving a new frame from the modem.
I am able to run any number of applications under Multi-Finder with NET always running in the background. I almost never have a crash and I run my machine 24 hours a day (Mac+ with 68030 &4meg's RAM).
Bdale has previously noted that the high data rates used by the DSY modem can "flat-line" your machine while it's busy servicing all that I/O. I *never* had that problem on the Mac (even before the 68030). However, now that some of the users on our 56k LAN are experimenting with DMA drivers and running "full bore" I do occasionally suffer from my machine "flat-lining". This only happens when two stations are ftping and using most of the available bandwidth.
As has been said before: The Grapes WA4DSY modem provides a MUCH higher cost/performance ratio, ie: you get a bigger bang for your buck.
I have not documented my modifications to the Pac-Comm tiny-2 tnc.
The procedure should not be too difficult for an advanced experimenter to figure out from reading the DSY documentation and from looking at the tnc's schematic. Alternately if your already have a tnc-2 clone you can follow the procedure described in the Grapes doc's and use your tnc as a host interface at 19.2k baud. (This works pretty well to start..)
Phil Karn has suggested that it should be possible to run HDLC straight out the serial port of the Mac. In practice this is not possible due to the absence of separate rx & tx clock signals.

I plan to have my station at the London Ontario Computer Networking Conference
for anyone interested in seeing it in action.

I don't know about other machines, but many of the current file transfer
programs (Lap-Link and the hopefully-soon-to-be-release Duette 3.0) that
run on IBM PC-compatable machines do. The parallel port is (for
lack of a better description or term) pseudo-latched in both directions.
When sending data, you load the latch and then pulse the strobe line,
which effectively tells the device on the other end to read the
port. The data stays in the latch after the strobe - it isn't cleared.
The device on the other end has a high enough Z so that the values
don't get distrubed. This assumes a read-only device, such as a
printer, is on the other end.

To read data the other way, you have the the machine on the other end
load it's latch and pulse its strobe. The receiving computer should
have cleared its latch prior to the sending computer loading its latch.
When the receiving computer sees the strobe, it reads the current contents
of its port, which should contain whatever the sending computer put there.

Obviously this whole scheme requires some deviation from the normal
handshaking line scheme in order for each computer to be able to use
its strobe line.

The IBM documention is probably a bit overprotective. As long as the
voltages on the pins don't exceed specs, there should be no problem.
The IBM technical manual also warns against transfer speeds above
9,600 baud on the serial port, which is a crock, so you can't believe
everything you read.

I haven't spent that much time on parallel port transfer routines. I
started on the project in writing Duette (formerly Lap-Link prior to
a trademark dispute, but that's another story), but turned it over to
a different programmer when I went away to college. Apparently, from
the reviews I've seen, the parallel port transfers work somewhat
faster than the 115,200 baud serial transfers. I'd estimate you would
get a throughput approaching the equivilent of 200,000 baud on a
well-designed parallel port routine, but for ease of development,
115,200 on the serial port isn't too bad either. The only problem
in an application like a token-ring network is allowing more than two
machines to communicate, as RS-232 is inherently designed for only 2
devices. But then again, so is Centronics parallel, so who's to say
what can and can't be done.

Anyone had any more experience on this? I'm by no means an expert.

--- Jeff

Doug gave a great overview how he did it.

I just want to mention that somebody mentioned to me that if you run your DSY modem half duplex, then you can easily hook it up to the Mac. You get a 2 to 1 multiplexer (which can be easily wired up from a 74HC00 quad CMOS NAND gate chip, costs 10 cents) and hook DSY TXclock onto one input, RXclock onto the other, and the select pin would go to DSY RTS. The output of the mux goes to the clock input of the Mac.

This allows you to eliminate the TNC.

All you have to do is write the code on the Mac to use this h/w arrangement. (It's only software!)

Best -Mike

Hello...

I've been reading the Packet Radio digest for some time now, and I'm really interested in what I've read. I am, however, just a beginner (not even, really) and _very_ new to the idea of packet radio. I've picked up a few ham magazines like CQ, and they help a little, but not a lot. With this in mind, I'd be delighted if one of you would help me with some basic questions:

What sort of license do I need to get started in packet radio? What's the best way to go about getting such a license? I've seen some ads for correspondance courses. Are these a good idea? What will it cost me, in both time and money?

What sort of equipment will I need? Intuition tells me I'll need some sort of radio setup, which I guess must include some sort of transciever and an

antenna. I would also guess I'd need some sort of modem, plus specialized software. I've already got a Macintosh SE. Is that any use at all? All the ads I've seen mention _only_ PCs... I haven't seen anything about the Mac thus far. If there are people using Macs with packet radio, where can I find them? Also, what will all this equipment cost me? I'm a student, so the cheaper the better.

If I _do_ get into packet radio, what will I be able to access? I like the idea of having a SLIP connection via airwaves, but that's a while off. Are there a great many packet BBS's out there? And how many people actually use packet radio?

I realize that this is all pretty basic stuff, and most of you probably don't want to spend your time telling everyone else what they already know. If there's some good way to find all this out... a few files FTPable from somewhere, a good book or two on the subject, a magazine article that I'll be able to find in a reasonable public library, whatever... I'd be grateful for the pointer.

Thanks very much.

   I am trying use MFJ 1270B for TheNet Node's. One is a backbone
   port and the other is for lan port. I am having problems getting
   the two to communicate togeather. I heard that in the TheNet
   documentation it describes hardware mods for the TAPR TNC-2, the
   MFJ-1270B is a clone of this. What mods do I need to make to get
   the two to communicate??

   Thanks in advance

Here is my perodic posting of the information on accessing the Amateur Radio BBS. I constantly see requests for software like NET and NOS, so here is where you can get the latest stuff!

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.08)
AA4RE BBS for the PC (Version 2.10)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

I've been reading the Packet Radio mailing list for several years now, but
I've not gotten excited about "Packet" until fairly recently. Specifically,
Last week I ran out of gas up by "The Valle Grande" and while I was waiting
for the gasoline to be brought up to me, (Two-meters has its uses...) I got
to talking with some old friends.

Seems that Scott was donating a packet repeater to be put up above Jemez
Springs, to give a ham down there a way out of his valley. We got to
talking and I offerred that I had a better site, and much better coverage
if we could get permission, etc, etc...

I got the permission, and now I've got some questions about my next steps.

I live in the high mountains of New Mexico, and this repeater will be able to
talk to Southern Colorado, Mount Taylor (over by Grants/Gallup), and
Capitan (down by Roswell), and West Texas. So it seems appropriate to
do a little extra.

Also, I have a 16 mHz AT-clone to spare, though at heart I am an Apple
person. So I want a solution which will work on both types of hardware.

I'd like to know whether I can run Phil Karn's TCP/IP stuff on my PC&Mac, (We call it a MikeIntosh, because it is a 128K Mac board stuffed up to be a 512E and inside an IBM-PC Clone case with an IBM monitor... Gets some stares from those who should know better...).

I have an early version of Phil's Mac program and I've FTP'd over the latest IBM version of something-or-other,

But, I'm not too sure about what to connect to where. I understand that a TNC is basically a Color-Computer with a special output port, and what I want to know is, What Radio-Frequency modem can plug into my serial port, (either the Mac or the AT-Clone) and, running TCP/IP sit off in my house and provide a 56KBaud Node? I think I don't need a TNC if I have a smart enough computer, is that true?

I expect to put SCO XENIX on the AT, just because of DOS. But the 386's I've tried to put Xenix on haven't worked, I've got to hope that a 286 version will work better... And with the software running TCP/IP itself, I shouldn't need too much hardware, should I? I suspect that there's nothing running out here but a bunch of generic 1200 Baud TNC packet BBS's. I have the opportunity here to set up a fast link if I understood what I am getting into. Although I may not be capable of building a "very high speed" modem, I have friends who could, so the availability of equipment is more a function of cost than skill required.

Can we run this thing (assuming 56KBaud and TCP/IP is considered "different" by the "true believers" of 1200Baud Packet) on the same frequency as the regular packet links? (i.e. will this just be another node, and the hardware oblivious to the RFModem tone's differences?) Will I require Two modems? I suspect that I want to be a "node", not just a digipeater; or do I?

1) IBM-AT-CLONE or Macintosh operation...
2) TCP/IP operation
3) Unix is better than DOS, The Mac doesn't do enough windows, but it does 'one window' really well.
4) I live above 8000 feet, I've had snow for 9-months straight several years...
5) Icom-22s for the radio, probably.
6) Node, or leaf? BBS with mail, etc. Store & forward etc...
7) High speed connectivity.
8) I "Hate" watching a slow typist backspace to correct a typing error. So good connectivity is important, I can read faster than 1200Baud, and I won't watch someone type...

I am talking of two separate machines. The digipeater up on the side of the hill will have some hardware digipeating connections so it will just retransmit whatever hits it, (although there is some discussion about putting it close to my kitchen so the computer could become more intimately connected if required by something or other that I don't understand yet.)

The second machine is down in my kitchen, an Icom 22s connected to an AT-Clone

or Mikeintosh and some type of RFModem which pushes the 22S's Transmit
button while screeching down the "Mike" line at 56K using TCP/IP.

Have I got it right?

     Dave, WB5PFS

&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&&

I promised myself (when I turned 21,) that I wouldn't ever again do
anything just once. I think that solves a lot of problems;
no high speed crashes into bridge abutments, no one-night stands, etc.

Dave--

I'm not sure I understand all of your questions, but I'll try answering the ones I think I understand. :-)

>I have an early version of Phil's Mac program and I've FTP'd over the
>latest IBM version of something-or-other,

You can get the latest Mac version via anonymous FTP from apple.com.

>   1) IBM-AT-CLONE or Macintosh operation...
>   2) TCP/IP operation
>   3) Unix is better than DOS, The Mac doesn't do enough windows,
>   but it does 'one window' really well.

Are these statements of fact or a wish list? In any event, the Mac version of Phil's software has had multiple windows for quite a while now; you probably have a fairly old version.

It also runs great under MultiFinder, in case you want to run BM and a text editor simultaneously. (I'm using 1 Meg for that; you might not be able to do it with 512K.)

Hope this helps.

73,
Patty

Subject: Re: The Fool on the Hill

Hello Jim and Patty,

Someone once donated me a PC clone...
I removed everything out of the case, and installed a 512Ke Mac motherboard...
Connected a powersupply and a floppydrive and started up NET/Mac...

It has been running perfectly well until I had to shut it down, because I
managed to get hold of a 20 MB harddisk...

Then I started it up again, and NET/Mac has been running in it ever since...

I cannot run it under MultiFinder, so Finder is the one you'll need, together
with SYSTEM 4.1.

The TNC1 could have been considered similar to the CoCo in that it used
the 6809 processor. The current TNC2 evolved out of the Xerox 820 and
uses a Z80. The TNC1 is no longer made and the TNC2 is much lower cost.
When used with Phil's code, the TNC runs in a special mode called KISS.
It does channel contention management, HDLC stuffing and unstuffing,
and acts as a smart buffer between the Async port to your computer
and the radio via it's internal 1200 baud modem. The TNC2 has a standard
disconnect header that allows other, faster, modems to be attached.
Currently available modems are 2400 baud, 9600 baud, and the Grapes
56 kbaud modems. The internal 1200 baud modem, the external 2400 baud
modem, and the external 9600 baud modem require external radios. The
56 kbaud modem is a radio and outputs on 29 Mhz. It requires a transverter
to boost it to the VHF/UHF band of choice. If you have a 8530 in the
computer, you can eliminate the TNC under certain special conditions.
For the PC you can use a card called the DRSI to replace the TNC,

the DRSI has a 8530 and an internal bypassable 1200 baud modem. There are
software drivers for this card in Phil's PC code for low speed work and
there is a driver for the 56 kbaud modem for the DRSI in Phil's code.
For the Mac, there is already an internal 8530, but both external
clock lines are not brought out. There was a tricky way to use it
half duplex posted here recently. You would need to do your own
high speed software driver unless someone has written one that
I am not aware of.

I use Sys V on a 386 with Phil's code. The standard TCP/IP for Unix
boxes doesn't understand AX25 link level nor are there drivers for
internal 8530 cards. I am using Phil's Net code version 890421
compiled for Sys V. It talks to a KISS TNC out a standard Async
port. This works well up to at least 19.2 Kb, this is the speed
I use to talk to the TNC. The TNC can talk to the world at 56 kb
thru a Grapes modem. There has been some recent work on an AX25
streams driver and a later version of Phil's code for Unix, but I
haven't kept up on this.

56 kb occupies 70 khz and is not permitted below 220 Mhz by the rules.
In general, it is not a good idea to run different speeds on the same
channel. The modems will not detect different speed activity since they
use different modulation methods and there will be many collisions.

>Have I got it right?

To my knowledge there is only one 56 kb "digipeater" operating in the world. It is a full duplex machine using two 56 kb modems on two different bands with a bit regenerator in between. All the other 56 kb modems are attached to computers either thru a 8530 interface or one of our special soupped up TNC2s. They act as true packet switches using Phil's TCP/IP code. With current versions of Phil's code, you have the ability to simulate a Netrom node, do full TCP/IP packet switching and routing, and with my Mulport code you can do multiport digipeating for the plain AX25 users who can't or won't use the Netrom routing. In Atlanta we have switches handling up to four low speed channels and one high speed channel operating. They form the backbone of our Lan system in North Georgia with the 56 kb trunks carrying mixed traffic of Netrom, digipeated AX25, and TCP/IP between the Lans. Our users are unaware of how their traffic moves, to them it seems as if everyone is on the same frequency using the same speed and mode they are using, but without all the contention and collisions that would normally kill the system.

Setting up a switched network like this is not "plug and play". It takes a lot of hard work to coordinate the links and a little hardware and software hacking to make it fly.

Dear sender:
I received some packet radio news via bitnet at Auburn University. I have
been trying to figure out how to subscribe to this service. Can you
tell me how I do that?

Thanks,

Stephen W. white

Subject: Re: Fool on the hill (2)

Hello Patty and Dave,

Why system 4.1? Because I think the docs that come with NET/Mac tell you
to do so when running on a 512K Mac, and because I just happend to have
that lying around. I guess it might as well be 4.2 or 4.3 as well!

The version of NET/Mac I'm running is 2.0 (as in Apple.com) with some
extra mods to get rid of the most serious bugs. The released version may
crash every now and then (not really often), but the one I've generated
didn't crash so far (it's been running for about 3 months now).

Regards,

How about adding the possibility to define a directory in the command
line to specify where to put the tmp files?
I don't like to see the "tmpXX.$$$" every time a make a "dir" command
with net.exe and with incoming smtp sessions etc....

Ok, now.. I am getting desperate.

Does ANYONE know ANY pointers as to where to get the Sytek 6120 (IBM PC Lan Adapter) cards - for free or for money? I would need half a dozen, but even one would help.

Give a name of the company that has used (or still uses) them, give me a dealer who has carried (or still carries) them.. anything.

Another missing part is an FSK receiver chip MC13055. The local import company didn't have them. Hate to call the factory and order 3000 pieces...

Please, help me to find these gadgets! And please, do realize that I REALLY don't care if I have to call overseas to U. S., to some exotic ever-never-land.. or whatever. In fact I don't care AT ALL where they might be found - as long as I can find them.

Thank you for your time,

     Luru

I've heard that the state tables (Appendix D) in the AX.25 Version 2.0 spec
published by the ARRL have errors. Is this true? If so, where are the errors
and what are the corrections?

How do I modify a TNC-2 to run 19200 baud to my PC? Is it as simple as
doubling the clock rate for the host port, or do I need to change out the
KISS rom to keep up with the data?

thanks,
  Mike Westerhof

I just got an AEA PK-232MBX Multi-Mode Data Controller and my intention is
to use this with a Kenwood TM-731A (2m/440) and a Mac.

I though I'd be on the safe side and solicit the net ham-radio/community
regarding this setup and any potential problems.

The AEA does not have specific instructions for the Kenwood TM-731A but the
Mic wiring *seems* clear. But, on some KW models the recommendation is to add
a 0.1 mf cap in series with the mic audio in. No reason is stated and my
specific model is not addressed. Do I need this and what's it for ?

Also, the pins on my KW are as follows: 1-Mic audio; 2-PPT(STBY); 3-Down;
4-UP; 5-8v/Max 50ma; 6-RX Audio output; 7-GND(Mic); 8-GND(PPT)

The AEA wiring diagram/cable wants a "brown" connected to the "common" PPT
and Mic ground. But, these are 2 separate pins on my mic connector. I
took a VOM and found that pin 7 (GND-Mic) and pin 8 (GND-PPT) seems to be
tied together internally. Further, the AEA guide recommends connecting
the cable shield to pin 7. This leads me to believe that "brown" and shield
should all be tied together to pins 7 and 8.

If someone could help me out with this - I'd appreciate it.
     => Do I need any 0.1 mf cap in the circuit ?
     => Are pins 7 and 8 wired together in the Kenwood ? My VOM seems to
        think so, although these are separate pins with separate designated
        functions as diagramed in the KW manual.
     => On the Mac serial interface. Do I need all the pins connected
        (1,2,3,7,8,20) or can I get away with just 2,3 &7 (transmit,
        receive, ground)?
     => Will I have a problem with "switching" times on the Kenwood?
     => What can I "blow up" if I hook this up incorrectly?
     => Any problems I should look forward to using the PK-232 ?

One other minor question, the Mic input impedance for the KW is 500-600
ohms. Nothing is said on the AEA specs about audio input levels or
impedance matching for their AFSK output from the PK-232 into the

transceiver. Isn't this important ? I would think so, the wrong impedance
or "overdriving" the mic input, I would think, has the potential to doing
some damage to the transceiver audio pre-amp/front-end... Right ?

Thanks,

It depends on the brand of TNC2 you have, the Paccomm already has a dip
switch for 19.2kb. The Original TAPR and MFJs need a simple wiring change,
run a wire from U1 pin 10 to the baudrate switch pin 1. Cut the existing
trace to SW pin 1. Now the 300 baud switch is a 19.2kb switch. Unless you
do the other modifications to speed up the TNC, you may drop characters. The
other mod is more extensive, but basically doubles the CPU clock and
replaces the CPU, SIO, RAM, and ROM with 6 Mhz parts. If you are using
a high speed modem, you will also need a modified KISS ROM that is
optimized to handle high speeds.

Does anyone have the format of the AEA pk232 commands that can be
exchanged in "host mode". It apparantly is in the technical manual
but alas I dont have it.
I would like my computer to talk to the pk232 at a lower level than
the normal method. I would also like to identify the source of the
stuff that comes back for the unit.
I would think the commands stay the same but are preficed with some
header.
                        Thanks,

More than a year ago I heard about a mailing list called "dsp-group"
through rec.ham-radio.packet. I got myself added to it, as a local
redistributor.

There was essentially no traffic on the list. The list maintainer was
ka7axd@wv.tek.com. I sent mail to him recently, and it was returned as
"User unknown". Is the list defunct? Has it perhaps been replaced in
spirit by comp.dsp?

The sort of repeater the FCC knows about receives & transmits at the same
time. The digipeaters, nodes, etc, receive and transmit at different times.
And only ties up one freq, and stay quiet unless someone specifically

addresses them. The funny cookie corp probably never gave any thought about digipeaters, nodes, etc before, and hopefully this guy's question wont make 'em think much about it, and leave things be.

If there's no rule forbidding something, than you can do it.

Snide-Comment: another one for you jailhouse lawyers

It seems that one of the local hams, Robb, KJ6YT, was wondering whether or not digipeaters, net/rom nodes, and the like count as repeaters or not, and whether they therefore have to be confined to the repeater subbands.

Since none of the local Part-97-in-hand types could answer the question, Robb dutifully called the local FCC office and asked them. Not getting a satisfactory answer there, he has written the Chief of the FCC Private Radio Bureau asking for clarification.

So if all of a sudden those of you who have been operating your nodes, digipeaters, and suchlike on non-repeater frequencies find yourself in violation of the rules, you will have hereby been warned.

Note: arguing about it HERE is profitless. It's what the FCC thinks that matters. Perhaps it will wind up becoming the NEXT rulemaking petition. Sigh.

> redistributor.
>

Dan:

To the best of my knowledge, all the folks really interested in it at the
time were all busy off doing Microsat, etc. TAPR and AMSAT are only
NOW finishing their plug in board to give to the ALPHA testers and code
writers. AEA will be releasing their proprietary hardware this fall
so DSP has not gone away, it just got put into the background by more
pressing demands. DSP will be on an amateur satellite soon. RS-14,
which will be the 21-st OSCAR (RO-21 upon launch), will carry a Harris
RTX-2000 and it performs a DSP function as modem demod-remod or repeater
or whatever. Should be interesting to say the least.

DSP has not gone away, it is truly about to (FINALLY) explode on the
amateur seen in a big way, it is just that Mike Horn's list was started
at the wrong time and never gained enough momentum to be useful.

Bob

This is a good reason NEVER to ask the FCC about anything. Otherwise they
may give an answer we don't want. Digipeaters have been outside the repeater
subbands for years and no one has ever been cited. Let sleeping dogs lie.

In article <18470@ucsd.Edu>, brian@ucsd.Edu (Brian Kantor) writes...
>It seems that one of the local hams, Robb, KJ6YT, was wondering whether
>or not digipeaters, net/rom nodes, and the like count as repeaters or
>not, and whether they therefore have to be confined to the repeater
>subbands.
>Since none of the local Part-97-in-hand types could answer the
>question, Robb dutifully called the local FCC office and asked them.
>Not getting a satisfactory answer there, he has written the Chief of
>the FCC Private Radio Bureau asking for clarification.

>   - Brian
>   "It is always easier to obtain forgiveness than permission."

Obviously, Robb doesn't believe in following Grace Hopper's advice,
quoted in Brian's signature.

This type of looking-for-trouble will be the death of ham radio.
Everytime somebody decides that maybe, something he's doing is
wrong, so let's make sure we're punished, we get punished.

I personally don't think a digipeater is a repeater. A repeater
operates in real time; digipeaters are a special case of third-party
traffic. (In America, of course. In other countries, ham-originated
messages aren't viewed as third party, which is often not allowed.)

But asking the FCC in writing? INSANE! It's called "asking for
trouble."

BTW, a full-duplex repeater can get about FOUR TIMES the data throughtput
as a digipeater, using only twice the frequencies, so it's FAR more
efficient. Digis are a dumb idea. They largely exist because nobody
has the balls to put a packet repeater on the air where the FM boys
have "claimed" all available pairs and the "coordinator" has an eternal
waiting list.

But we've argued that out previously.

If you ask the FCC if you are allowed to do XYZ, what will the underpaid and
understaffed FCC people do with your request? They won't do much with it.
If you are lucky they will trash it. Eventually they will get around to
answering it.

If XYZ is blatantly and obviously legal, they will tell you so. You will be
making their job at least a bit more humorous in this case. The kind of
questions that fall in this category are also eligible for being on the
written exam anyway. You are supposed to know better.

If there is any doubt whatsoever that XYZ is legal; if there is any chance
at all the XYZ might not be legal, they will NOT tell you that it is legal.
No government agency will ever do this for anything, EVER! Who would?
Your lawyer and the courts. That's their function.

The FCC staff lawyers do not have the authority to interpret FOR YOU what
the meaning of the rules is. They never will. They are not "yes men"
either.

The FCC enforcement people are not out to get you. If you want to do XYZ
and are not sure if it is legal or not, you can find out by just doing XYZ.
If in the eyes of the FCC it is illegal, they will tell you so. More often
than not, if there is a doubt, they won't bother; they have other things
to do. You can go on happily doing XYZ.

Before you do XYZ, apply a simple sanity check to it. Will doing XYZ cause
interference to any other communication, amateur or otherwise? If so, then
you should not do XYZ. Will it get complaints from OTHER THAN the "armchair
lawyer" types? If so, reconsider doing XYZ, or try XZY instead.

Also, examine XYZ closely with respect to the national, regional, and/or
local band plans, as appropriate. Make sure that you are conforming to
the bandplan if there is any use of the band in your area.

But what if the "armchair lawyer" type complains to the FCC? Let him.
The FCC will ask you what you are doing. They don't take people's word
for it, they investigate. Tell them exactly what you are doing. If they
believe it is illegal, they will tell you and you can stop.

What if someone starts jamming you while doing XYZ? Treat it as jamming
in any other case. Ask them to stop, quoting chapter and verse. If they
don't, file an interference complain through the appropriate steps. It would
probably help greatly to start with local official observers first since the
FCC really doesn't want to hear about it if there is a chance it can be
resolved by hams themselves.

Talk to other hams about XYZ. You almost certainly will get some negative
responses. Listen to those responses and see how logically they are derived
from the actual rules. And by all means read the rules IN THEIR ENTIRETY.
Then make your own decisions about doing XYZ. If you still aren't sure,
then consult a lawyer (a real one).

In article <15215@shlump.nac.dec.com> goldstein@carafe.enet.dec.com (Fred R. Goldstein) rants once again about how bad frequency coordination is:
>BTW, a full-duplex repeater can get about FOUR TIMES the data throughtput
>as a digipeater, using only twice the frequencies, so it's FAR more
>efficient. Digis are a dumb idea. They largely exist because nobody
>has the balls to put a packet repeater on the air where the FM boys
>have "claimed" all available pairs and the "coordinator" has an eternal
>waiting list.

1) Digis are also much simpler to build and operate than full-duplex radio repeaters, since you don't have to keep the transmitter out of the receiver.
2) FLAME ON:
"Nobody has the balls" to start repeater wars, huh? Damned right! We've outgrown that stage. Plopping a radio on an occupied frequency is simply bad practice. You may hate repeater coordination - and from your repeated unreasoning ranting about the subject, I suspect you hold a personal grudge against your local coordinator - but, DAMMIT!!, it's the way things get done in ham radio. You'd best put up with it, for YOU will get the pink slip if your uncoordinated repeater interferes with someone's repeater who has jumped through the few hoops required.

Have you ever even submitted an application for coordination? I doubt it. You hold too many preconceived notions on the subject that just plain don't match the facts.

>But we've argued that out previously.

Then why the hell don't you let it drop? Your anti-coordinator flamage is as tiresome and offensive as Phil Karn's unreasoning anti-OSI flamage. We've heard it all before, and we're tired of it. Give it a rest.

There's not much standard around here, except for TCP/IP users using -8 (and
up for multiple stations). We have no standard for NETROM IDs yet, but I've
proposed one which may gain some acceptance:
Take the low order 24 bits of the IP address. Use the top 4 bits to form one
hex digit, and then take the remaining 20 bits in groups of 5 to make 4
base-32 digits in the range 0-9a-v. Put a leading # to make the name private.
Example: My IP address is 44.76.0.92. This makes:
        44   76   0   92
0 0 0 1 1 1 0 0|0 1 0 0 1 1 0 0|0 0 0 0 0 0 0 0|0 1 0 1 1 1 0 0
(ignore this) | 4 | O | 0 | 2 | S

This is guaranteed to be unique for all AMPRNET hosts. The bit-twiddling
can be done by a simple C routine, and might even be built into the netrom
commands in NOS. I know there's been a similar scheme mentioned on
Compu$erve, but that one (using the hex representation of the low 16 bits)
would break down at the edges of the assignment areas.

Comments, anyone?

I am interested in getting hold of a tnc and was wondering what the benefits or otherwise were of buying one that was packet only, or going for a multi-mode unit with rtty,morse,fax etc. Is it better to have all the modes you may want tied up in one box, or have seperate boxes. How much use do you really get from some of these other modes after you've looked at several weather pictures from mongolia etc ... Packet is what I want now, but do these multi-mode units give upgrade options for external modems etc ? Would anyone even like to go so far as to suggest advantages and disadvantages of the major brands ?? (Ive been looking at the MFJ)
Also - is there any software available for the macintosh to run tcp/ip over packet. Is is public domain, FTP'able? or where can you buy it etc ...

Any help would be appreciated, mailed rather than posted please.

No offense, but prejudice aside, how robust do you think token is going to be in a radio environment? My guess is that in any interesting radio net you'd spend more than half the bandwidth would be wasted recovering from lost tokens. CSMA/CD is much less flawed once you consider token loss.

At present, I believe ethernet cards are much cheaper than token-ring
cards. Since it's only the *transport* medium to the NNC, then how it
gets done should be as cost effective as possible.

Also, from a cards builders perspective, I'd tackle a ethernet design
before a TR design. Six vendors sell ethernet chipsets, one or two
sell TR chip sets (well, three, but they won't sell to me).

PCB Real Estate and chip costs quickly become factors.

|> Ethernet, particularly for intensive real-time applications, is seriously

In general, that hard to argue with. However, if we could come up with some
serious ideas about what RT applications should be implemented, we can
then decide how to adapt what we have.

|> flawed (well, CSMA/CD is flawed full stop!) maybe someone should implement a
|> token-based amateur packet protocol?

Token-based protoocols start to make sense when you consider the use of
point to point RF. One could build an amateur radio network that is

much like a token-ring, but I think that might require more cooperation among ourselves than we're presently willing to do.

    Well, the good old argument, token passing vs. csma/cd. How do you implement a practical token passing network over a relatively unreliable link?

    It isn't too hard at first to envision a topolgy which isn't outright functionless. A mountain top digipeater would act as the 'active monitor' and somehow build a list of nodes, passing the token to each one in turn. (This ends up a token bus, not a ring). When a node wishes to leave the net, it would wait for the token to come around and then transmit a message removing itself from the topology. What about a node wishing to join the topology? Oops, now we've got a CSMA scenario again.... since the node wishing to join the topology will never be passed the token, any transmission from him is in danger of colliding with some other node. What about nodes which can't see the mountain top but can see another node who is in the topology... what kind of protocol can be developed to allow the hidden nodes to join the topology?

    CSMA does indeed have some problems, compounded by the fact that Collision Detection is impractical in the scenario. A node using a duplex repeater could possibly be able to listen to output of the repeater

and detect a collision, but a simplex station can not do this (if you don't believe me, send me a note and I'll explain why even a diverse node - where the transmitter is some distance from the receiver - would not be practical). It seems most packeteers insist on running with a persistance of 1 (that is a P of 255) which rapidly clogs a channel beyond usefulness as loading increases. So, we encourage collisions and have no way of providing a rapid recovery. Yuck.

  But, what else can we do? We don't have any 'packet network czars', so every station is free to run whatever parameters they wish. Furthermore, the performance from each node is essentially dependent on what every OTHER node is doing; try being the nice guy running p=.1 on a normal channel (where everyone else is running p=1)....

  As for interfacing to a TNC over a network, it really makes no difference which kind of network is in use if the loading is light and topology is small. Furthermore, the cheapest token ring interface I've seen is still a lot more money than the cheapest ethernet interface. Token-Ring (802.5) is a MUCH more complicated network than Ethernet.

Why stick with Ethernet for linking TNC's. CSMA/CD and TCP/IP are from a protocol point of view, at best both kludges. Some of us (who use IBM kit exclusively) would like a Token-ring version. Bear in mind that the current unit sales of ethernet & token-ring are approximately equal in the commercial world. Equally, I would *LOVE* a MCA-bus version of the DRSI card (or equivalent) to appear. AT-buses and 8088's just dont thrill me anymore. Ethernet, particularly for intensive real-time applications, is seriously

flawed (well, CSMA/CD is flawed full stop!) maybe someone should implement a token-based amateur packet protocol?
Would possibly get round the current scenario where everybody collides so nobody gets through.

DOVE, the Digital Orbiting Voice Encoder microsat seems to be steadfastly back on 2m now. But the telemetry packets have two fewer channels than before. Does this mean that the whole set of telemetry channels has been changed or reorganized or that just the last two (related to the S-band xmtr) have been dropped? Also, is there a new set of telemetry equations to go along with the new format? There appear to be more non-zero values in the status bits now too. Is there an up-to-date description of what they all mean? Many thanks in advance for any help anyone can offer.

Oh boy, here we go again with the token-ring vs bus wars. I hope
you're being facetious, but just in case... What's so "kludgey" about
Ethernet and TCP/IP, and more importantly, what do you have to offer
that's truly better?

> Ethernet, particularly for intensive real-time applications, is seriously
> flawed (well, CSMA/CD is flawed full stop!)

This is a bit of particularly egregious misinformation kept alive by
the token ring salesmen. See the excellent paper by Boggs, Mogul and
Kent in the 1988 SIGCOMM procedings ("Measured Capacity of an
Ethernet: Myths and Reality"). Basically, Ethernet continues to
operate at nearly its full capacity of 10 Mb/s even when the offered
load is far greater. Obviously not everyone gets their traffic through
under such conditions, but neither will a token ring!

Another point made in the paper is that even under heavy overload,
each Ethernet station gets a roughly equal share of the bandwidth when
averaged over several packets. Since fairness under overload is usually
touted as the big advantage of a token ring, this is a most interesting
result.

In other words, a properly built Ethernet and a properly built token
ring will both work just fine as long as the aggregate traffic is less
than the data rate of the medium, and neither Ethernet nor token ring
will satisfy their users when the aggregate demand exceeds the
capacity of the media. And given that most hams probably won't
overload their shack Ethernets very often, the issue is moot anyway.

So a decision between them should be made on the basis of other
factors such as the cost, quality, availability and vendor support of

each type of interface. And on this basis Ethernet wins hands down.
Ethernet is much more widely supported than token ring by every vendor
except IBM, and the Ethernet market is much more competitive. If you
want a multi-vendor LAN, you don't have much choice.

> maybe someone should implement a
> token-based amateur packet protocol?
> Would possibly get round the current scenario where everybody collides so
> nobody gets through.

This is an entirely different issue, and you may well have a point.
Every channel access algorithm has a regime in which it works well.
Just because CSMA/CD works fine at 10 Mb/s on coax cables up to 1500m
doesn't mean it will work well on packet radio where the conditions
are quite different. Our experiences bear this out. Token passing is
definitely one of the schemes that should be tried, although it too
has many practical problems that need to be dealt with.

OK so Token-ring is more expensive; at the moment.......

 In the meantime, has anybody thought of using the parallel printer
port? Bi-directional (if you have kosher hardware), essentially TTL
levels (so should be dead easy to hook straight into the TNC),
factory-fitted on most industry-standard computers, and oodles faster than
poor slow serial RS232!
This port is wasted on most dot-matrix printers; stick your printer on
the RS232 and use that parallel-port for something exciting.

Current amateur packet operation does not fit well with the CSMA/CD model due to the infamous hidden terminal problem. This is a level 1 issue of course and could, in principle, be solved by going to full duplex operation or by using some form of microwave point to point links. Neither solution is universally available. On HF, a full duplex channel is impossible due to propagation. On VHF/UHF/SHF, point to point is impossible for some of our users since they can hear no one else directly and must use the high site digi to operate at all. At least with p-persistence and exponential backoff, Phil's TCP/IP code allows some thruput while preventing congestive collapse.

Current amateur packet channels are very lossey with many packets never reaching their destinations, not because of collisions, but because the radio channel is not 100% reliable. This is not likely to change. This gives backoff algorithms fits and makes a backoff cap mandatory.

Further, amateur operation is by nature chaotic. Stations join or leave the channel at random times. User expectations of packet capability vary wildly. And the technical sophistication of user equipment covers a wide spectrum.

Thus, while the current CSMA scheme has serious warts, implementing a token ring amateur packet protocol appears nearly hopeless. Token ring demands much better radio paths than we are likely to get. Token ring requires a known, well understood, network topology that does not change minute by minute. And given the relatively long key up delays of current packet equipment, much channel capacity is going to be wasted simply passing the token by stations that currently have no traffic for the net. The problem of regenerating lost tokens is severe as is the problem of users dropping in and out at random.

Taking the realities of packet operation into account, does anyone have suggestions for realistic protocol improvements?

I have investigated this recently for another application. My T1000 laptop (4.77 MHz 80C88) is only good for about 10-20 Kbytes/sec, with hand-optimized assembly language. I am normally an Intel fan but I/O on 80x86 machines is a horrible pain. (Load DX with one port address, input to AL, move it somewhere, load DX with a different port address...Argh) My 286 desktop doesn't have a bidirectional printer port (monographics/printer card with one ASIC) and no visible provisions for making it so. Everything has to be done serially thru the handshake lines...

Now 10-20 Kbytes/sec is nothing to sneeze at compared to RS232 but it is nothing at all compared to some sort of a DMA channel like a LAN or SCSI.

Gary, reconsider a token-passing scheme using pairs of microwave dishes at every QTH. Or one central site with one dish per user, and one dish per user (star configuration, actually, and rather like the Hubmaster concept discussed by N6GN, N6RCE and N6PLO in the upcoming CNC).

Token-passing looks pretty good in those situations, I think.

I've seen a number of references to a 'DCD mod' to be applied to
TNCs in order to provide enhanced carrier-detect performance when
the radio is used unsquelched. However, I can't find any
documentation on this mod.

Does it look for valid data (less than 5 1's, or a flag), or RX
clock in fixed phase-relationship to TX clock, or data transitions
at no faster rate than recovered RX clock, or what ?

Do they perform any function that can't be performed in software
using the HDLC controller's flag and abort detect hardware ?

Why attempt it? Let's fix the link problems. Packet isn't weak signal work, and we're not trying to get WA BBasses.

Lets approach the packet networking problem *assuming*:

1) C/N ratios such that we get BER in the range of 10**8
2) NO hidden transmitters on the links.

Well, at least most of the time, 'cept for the occasional tropo duct, in which case I'm off the air for packet anyway, working someone S9 in LA on 100mW.

   Now, wait a minute.... you could cheat. The 'standard' IBM printer port
has the ability to read back the data on the output pins. If you write
0xFF to the output port, then have an external device pull-down the pins
he wants to be 0s, you'd read back the correct data.

  This is quite nasty, though. I've been hesitant to post it. The worst
case is that all 8 bits are pulled low... this results in something like
250 mA of current flowing through the 74LS374 latch. If you keep the duty
cycle low you'd probably be just fine. So, you could run bi-dir at a
much higher rate (over 100 Kbytes/sec) if you wish...

This looks very good Mike for those who can arrange line-of-sight
access for permanant links. It leaves out the portable and possibly
mobile users completely. It would work on many backbone links and
in some special cases for general users. I see no problem with
this for special cases and see no compelling reason why everyone
must use the same link level protocol. However, I fear that with
the limited resources most of our groups have, we would slight
one or the other group of users by dividing our ranks. As you
know, we aggressively support 56kb here, but we are still allowing
users direct access to the 56kb backbone trunk switches because
we haven't mustered the people resources to put up a dedicated
56kb lan switch. In fact we are spending a lot of our limited time
trying to keep existing 1200 baud links running for our users who
haven't yet taken the 56kb plunge. Our user base breaks down to
about 600 active 1200 baud users, 200 2400 baud users, 12 56 kilobaud
users, and one lonely 9600 baud user (me). These are spread over
5 56kb trunk switches and 10,000 sq miles of hilly terrain. I
love this fast high tech stuff, but I can't hit a 56kb switch
from my location.

Are there any support groups for the families of people who have been
trapped in the conflict in Kuwait? In particular are there any sources
of hard information on what is happening to the people who have been
moved out of Kuwait into Iraq?

Is Kuwait still active on Amateur Radio, or have all the stations been
closed? Is anything coming out of Iraq?

Please send mail, and I will summarize.

The words "standard" and "IBM" do not belong in the same phrase. :-) Most
microcomputer manufacturers are more interested in minimizing cost and chip
count than in adhering to standards. (Case in point: I'm not sure there
is *any* PC which really adheres strictly to RS232. If your serial port
advertises reliable functioning faster than about 19.2k, for example, it
is ignoring the RS232 slew-rate limits.) It's not at all unlikely that
some manufacturers, particularly the AT-on-3-chips types or the battery-
portable manufacturers, are reading back the register rather than the
pins, or implementing the port in CMOS that will fry if you make a habit
of out-muscling its output transistors.

Since the topic of channel access algorithms has come up, I
thought I might post the paper I just submitted to the ARRL
Computer Networking Conference. Comments are solicited.

To print this paper, run it through [tn]roff -ms. --Phil

```
.TL
MACA\** - A New Channel Access Method for Packet Radio
.AU
Phil Karn, KA9Q
.AB
The existing Carrier Sense Multiple Access (CSMA) method widely used
in amateur packet radio on shared simplex packet radio channels
frequently suffers from the well-known "hidden terminal problem" and
the less well known but related problem of the "exposed terminal."
This paper proposes a new scheme, Multiple Access with Collision
Avoidance (MACA), that could greatly relieve these problems.  MACA can
also be easily extended to provide automatic transmitter
power control. This could increase the carrying capacity of a channel
substantially.
.AE
.2C
.PP
.FS
MACA is an acronym, not a Spanish word.
.FE
.NH 1
Introduction
.PP
In the classic hidden terminal situation, station Y can hear both
stations X and Z, but X and Z cannot hear each other.
X and Z are therefore unable to avoid colliding with each
other at Y. (See figure 1.)
.PP
In the exposed terminal case (figure 2), a well-sited station X can hear
far away station Y. Even though X is too far from Y to interfere with
its traffic to other nearby stations, X will defer to it unnecessarily, thus
wasting an opportunity to reuse the channel locally. Sometimes there
can be so much traffic in the remote area that the well-sited station
seldom transmits. This is a common problem with hilltop digipeaters.
.PP
This paper suggests a new channel access algorithm for amateur packet
radio use that can minimize both problems. This method, Multiple Access
with Collision Avoidance (MACA), was inspired by the CSMA/CA method
(used by the Apple Localtalk network for somewhat different reasons) and by
the "prioritized ACK" scheme suggested by Eric Gustafson, N7CL, for
AX.25. It is not
only an elegant solution to the hidden and exposed terminal problems,
```

but with the necessary hardware support it can be extended
to do automatic per-packet transmitter power control. This
could substantially increase the "carrying capacity" of a simplex
packet radio channel used for local communications in a densely
populated area, thus satisfying both the FCC mandate to use "the
minimum power necessary to carry out the desired communications" (Part
97.313) and to "contribute to the advancement of the radio art" (Part
97.1 (b)).
.NH 1
How CSMA/CA Works
.PP
CSMA/CA as used by Localtalk works as follows. When a station wants to
send data to another, it first sends a short Request To Send (RTS)
packet to the destination. The receiver responds with a Clear to Send
(CTS) packet. On receipt of the CTS, the sender sends its queued data
packet(s). If the sender does not receive a CTS after a timeout, it
resends its RTS and waits a little longer for a reply. This three-step
process (not counting retransmissions) is called a \fIdialogue\fP. Since
a dialogue involves transmissions by both stations, I will avoid
confusion by referring to the station that sends the RTS and data
packets as the \fIinitiator\fP, and the station that sends the CTS as
the \fIresponder\fP.
.PP
The RTS packet tells a responder that data follows. This gives the
responder a chance to prepare, e.g., by allocating buffer space or by
entering a "spin loop" on a programmed-I/O interface. This is the
main reason Localtalk uses the CSMA/CA dialogue. The Zilog 8530 HDLC
chip used in the Apple Macintosh can buffer the 3-byte Localtalk RTS
packet in its FIFO, but without a DMA path to memory it needs the CPU
to transfer data to memory as it arrives. The CPU responds to the
arrival of an RTS packet by returning a CTS and entering a tight read
loop, waiting for the data to arrive. ** (A timeout prevents a system
lockup if the data never arrives.)
.FS
It would be nice if we could use this feature on packet radio with our
programmed-I/O HDLC interfaces (e.g., DRSI PCPA, Paccomm PC-100).
Unfortunately, if our RTS/CTS packets carry full source and
destination call signs, they would not fit into the 3-byte 8530 FIFOs.
So high speed operation will still require either DMA or a dedicated
I/O processor.
.FE
.PP
As is standard for CSMA schemes, CSMA/CA requires stations to stay off
the channel when another transmission is already in progress.
CSMA/CA also requires any station that overhears an RTS or
CTS packet directed elsewhere to inhibit its transmitter for a
specified time. This helps reduce the probability of a collision with
a subsequent CTS or data packet. This is the CA or \fICollision
Avoidance\fP part of CSMA/CA. However, collisions are not a major
problem on Localtalk; the network is physically small, carrier sensing
is fairly rapid, the data rate is relatively low, and (if the network
is properly built) there are no hidden terminals. Plain CSMA would
work well, but there was little extra cost to the CA feature (given

that the RTS/CTS dialogue was already needed for other reasons) so it
was included.
.NH 1
Turning CSMA/CA into MACA
.PP
Hidden and exposed terminals abound on simplex packet radio channels,
and this makes them very different from Localtalk and most other types
of local area networks. When hidden terminals exist, lack of carrier
doesn't always mean it's OK to transmit. Conversely, when exposed
terminals exist, presence of carrier doesn't always mean that it's bad
to transmit. In other words, the data carrier detect line from your
modem is often useless. So I'll make a radical proposal: let's ignore
DCD! In other words, let's get rid of the CS in CSMA/CA. (It's too hard
to build good DCD circuits anyway...)
.PP
Instead we'll extend the CA part of what we'll call MA/CA (or just
plain MACA). The key to collision avoidance is the effect that RTS
and CTS packets have on the other stations on the channel. When a
station overhears an RTS addressed to another station, it inhibits its
own transmitter long enough for the addressed station to respond with
a CTS. When a station overhears a CTS addressed to another station, it
inhibits its own transmitter long enough for the other station to send
its data. The transmitter is inhibited for the proper time even if
nothing is heard in response to an RTS or CTS packet.
.PP
Figure 3
shows an example. Station Z cannot hear X's transmissions to Y, but it
\fIcan\fP hear Y's CTS packets to X. If Z overhears a CTS packet from Y
to X, it will know not to transmit until after Y has received its data from X.
.PP
But how does Z know how long to wait after overhearing Y's CTS?
That's easy.
We have X, the initiator of the dialogue, include in its RTS packet the amount
of data it plans to send, and we have Y, the responder, echo that
information in its CTS packet. Now everyone overhearing Y's CTS knows just
how long to wait to avoid clobbering a data packet that it might not
even hear.
.PP
As long as the link between each pair of stations in the network is
reciprocal (i.e., all the stations have comparable transmitter powers
and receiver noise levels), the receipt of a CTS packet by a station
not party to a dialogue tells it that if it were to transmit, it would
probably interfere with the reception of data by the responder (the
sender of the CTS). MACA thus inhibits transmission when ordinary CSMA
would permit it (and allow a collision), thus relieving the hidden
terminal problem. (Collisions are not \fItotally\fP avoided; more on this
point later.)
.PP
Conversely, if a station hears no response to an overheard RTS,
then it may assume that the intended recipient of the RTS is either down or
out of range. An example is shown in figure 4.
Station X is within range of Y, but not
Z. When Y sends traffic to Z, X will hear Y's RTS packets but not Z's

CTS responses. X may therefore transmit on the channel without fear
of interfering with Y's data transmissions to Z even though it can hear
them. In this case, MACA allows a transmission to proceed when
ordinary CSMA would prevent it unnecessarily, thus relieving the
exposed terminal problem. (Because modems have a capture effect,
hearing a CTS doesn't \fIalways\fP mean that you'd cause a collision
if you transmit, so the problem isn't yet completely solved. More on
this point later.)
.NH 1
Metaphors for MACA
.PP
MACA is not really a novel idea; it merely formalizes a procedure many
people (not just radio amateurs) instinctively use in personal
conversation. A typical cocktail party has many simultaneous
conversations. The average guest seldom waits for total silence in the
room before he speaks, but if someone asks him to pause because he is
trying to hear someone else, he will usually do so. The MACA RTS
packet is analogous to Bob saying "Hey, Tom!" and CTS packet is
analogous to Tom responding with "Yeah, Bob?". This causes most people to stop
talking if they are close to Tom (except, of course, for Bob). The same
thing (should) happen in manual amateur radio operation whenever a
station finishes a transmission with "go only" (or "KN" on CW or RTTY).
.PP
The Prioritized ACK scheme also involves overheard packets that
inhibit other stations for specified periods of time. In this case,
the inhibiting packet is a data packet and the protected station is
sending an acknowledgement that may not be audible at the inhibited
stations. Full protection against collisions is not provided (data
packets can still collide) but the performance improvement due to the
lower ACK loss rate is reported to be substantial.
.PP
More formally, MACA can also be seen as a single-channel,
time-multiplexed form of Busy Tone Multiple Access (BTMA). In BTMA,
receivers transmit "busy tones" on secondary channels whenever their
receivers are active. This warns the other stations in range that they
should not transmit even if they hear nothing on the data channel. On
the other hand, stations not hearing busy tones are free to transmit
even if there is already a signal on the data channel. Indeed,
stations need not pay any attention at all to the data
channel when deciding to transmit; only the busy channel matters. As
long as the propagation characteristics are identical between the main
and secondary (busy tone) channels, BTMA is effective. Unfortunately,
the need to use widely separated frequencies to avoid
self-interference tends to make the link characteristics less
symmetrical. BTMA also obviously increases the hardware complexity and
spectrum requirements of each user station. On the other hand, because
MACA uses the same channel for the "busy tone" and data, paths
between pairs of stations are much more likely to be symmetrical.
.NH 1
Collisions in MACA
.PP
Unlike BTMA, however, collisions between RTS packets can still occur
in MACA. These are minimized with a randomized exponential back-off

strategy similar to that used in regular CSMA. Since there is no carrier sensing in MACA, each station simply adds a random amount to the minimum interval each station is required to wait after overhearing an RTS or CTS packet. As in regular CSMA, this strategy minimizes the chance that several stations will all jump on the channel at the instant it becomes free. The extra random interval would be an integral multiple of the "slot time", and in MACA the slot time is the duration of an RTS packet. If two RTS packets collide nonetheless, each station waits a randomly chosen interval and tries again, doubling the average interval on each successive attempt. Eventually one of them will "win" (i.e., transmit first) and the CTS from its responder will inhibit the "losing" station until the winning station can complete its dialogue.
.PP
Even though collisions can occur between RTS packets, MACA still has the advantage over CSMA as long as the RTS packets are significantly smaller than the data packets. As long as this is true, collisions between RTS packets are much less "costly" than the collisions that would otherwise occur between data packets. The savings in collision time also pays for the overhead of the RTS and CTS packets.
.PP
As mentioned earlier, the basic MACA protocol only reduces the chances of collisions involving data packets; it does not guarantee that they will never occur. This is because a CTS packet requires a certain minimum signal-to-noise ratio at a station for it to be understood and obeyed. Even if the station powers are well matched, a pair of stations might have just enough of a path between them to allow them to interfere with each other's reception of weak signals, but not enough of a path to allow them to hear each other's CTS packets. Although the seriousness of this problem is unknown, it does appear that the power-controlled version of MACA discussed later would greatly reduce it.
.NH 1
Bypassing the MACA Dialogue
.PP
If the data packets are of comparable size to the RTS packets, the overhead of the RTS/CTS dialogue may be excessive. In this case, a station may choose to bypass the normal dialogue by simply sending its data without the dialogue. It must, of course, still defer to any RTS or CTS packets it may overhear.
.PP
Of course, the bypass mechanism carries with it the risk of a collision. However, for some types of data packets this may be an acceptable tradeoff. An example might be the acknowledgements in a sliding-window TCP transfer.** TCP ACKs are cumulative, so the loss of a single ACK causes no harm as long as another one gets through before the sending TCP fills its window.
.FS
The use of sliding windows in TCP might seem to contradict the advice I gave several years ago to always operate in stop-and-wait mode (\fBMAXFRAME\fP 1) on half duplex channels. However, that conclusion applied only to link level protocols; TCP is an end-to-end transport protocol. Sliding windows are usually appropriate in a transport protocol even when the

individual hops in the network path are half duplex.
.FE
.NH 1
Automatic Power Control
.PP
MACA lends itself well to automatic transmitter power control. To
support this we need some extra hardware: a D/A
converter that controls transmitter power level, and an A/D converter
that gives received signal strengths. By including calibrated
"S-meter" readings** in CTS packets, responders could help initiators to
adjust their power levels accordingly.
.FS
Only one point in the S-meter scale really needs to be calibrated.
This is the signal level just high enough to achieve an
acceptable bit error rate. A more completely calibrated scale
makes it easier for the transmitter to zero in on the correct power setting,
but even a simple "too strong/too weak/OK" indication is enough
for a transmitter to determine the correct power level by Newtonian
iteration.
.FE
.PP
Each RTS/CTS exchange updates the initiator's estimate of the power
needed to reach a particular responder so that future packets
(including the data packet in the current dialogue) can be sent with only
the necessary power. Even RTS packets could be sent at reduced power,
since their main purpose is to elicit a CTS from the responder. This
reduces the probability of collision between RTS packets.
.PP
By changing the MACA rule to "inhibit a transmitter when a CTS
packet is overheard" to "temporarily limit power output when a CTS
packet is overheard,"
geographic reuse of the channel can be significantly improved.
For example, if
station X has recently sent traffic to station Y, it knows how much
power is required to reach Y. If X overhears station Y responding with a
CTS to a third station Z, then X need not remain completely silent for the
required interval; it need only limit its transmitter power to, say, 20
dB ** below the level needed to reach Y. During this time it would be free
.FS
This figure depends on the capture ratio of the modems in use.
.FE
to transmit to any station that it could reach with that reduced power
level, because its signal at Y would be overridden by Z's
signal. (This is analogous to the people at the cocktail party
continuing their conversations in whispers instead of stopping
completely when Tom tells Bob to go ahead.)
.PP
The CTS packets, however, pose a problem. In addition to telling the
initiator to send its data, the CTS must inhibit all potential
interferers from transmitting. It may therefore need more power than
that needed just to reach the initiator to ensure that everyone "gets
the message." (A CTS packet might therefore be more like Tom shouting
"Hey, everyone, shut up! I'm trying to hear Bob speak!" at the cocktail

party mentioned earlier.)
.PP
All this shouting potentially limits the geographic channel reuse ability we've worked so hard to get. But all is not lost. A station responding to an RTS with a CTS can always expect data to follow. If it doesn't arrive within a reasonable period, or if a retransmitted RTS arrives instead, then either the CTS was stepped on, or the CTS wasn't heard widely enough to prevent the data transmission that follows from being stepped on. It should then respond to the next RTS from the same station (which will likely be a repeated attempt to send the same data) with a CTS at higher power. On the other hand, if a responder has had good luck in getting data in response to its CTS packets, it might try lowering the power it uses to transmit them in order to help limit channel loading. Of course, it would never lower its CTS power below the level it knows is necessary to reach the initiator.
.PP
In sum, MACA with power control automatically determines the exact amount of power required for each RTS and data transmission, and learns by experience (i.e., trial and error) the power required for CTS transmissions. It also appears to avoid the runaway power escalation that can occur when power control is done on a conventional CSMA channel when stations naively "turn up the wick" each time they fail to get through. About the only time power escalation seems possible in MACA is when an initiator's receiver fails so it is not able to hear CTS responses to its RTS packets no matter how much power the responder uses. This possibility should be handled by back-offs and/or retry limits in the dialogue code.
.NH 1
Applications for MACA
.PP
If MACA proves effective, it may \fIfinally\fP make single-frequency amateur packet radio networks practical. Although it would still be preferable for fixed backbones to use separate, dedicated channels or point-to-point links whenever possible, the ability to create usable, ad-hoc, single frequency networks could be very useful in certain situations. These include user access channels (such as 145.01 MHz in many areas) and in temporary portable and mobile operations where it is often infeasible to coordinate a multi-frequency network in advance. This would be especially useful for emergency situations in remote areas without dedicated packet facilities.
.PP
An ideal emergency packet radio network would consist of identical stations operating on a common frequency (to maximize interchangeability) placed in arbitrary locations. These stations would automatically discover their neighbors and build routing and power control tables that maximize the total amount of traffic that can be carried in the coverage area. To do this, routing algorithms would use a different metric than usual. Instead of simply minimizing the number of hops needed to reach a given destination, the routing algorithm would instead minimize the \fItotal transmitter energy\fP required by all the stations along a path to the destination. Because of the laws of RF propagation (doubling the range of a signal in free

space requires four times as much transmitter power, and on the ground
it may take much more), this approach would often \fIincrease\fP
the number of hops required to reach a given destination. However,
overall network throughput would increase because the lower
transmitter power levels would permit more simultaneous transmissions
to occur in different parts of the network without interference. This
would also minimize the power consumed at the stations, and this could
be important when operating from batteries. The direct,
minimum-hop path could
still be provided as an option for special applications requiring
minimum delay.
.NH 1
Conclusion and Open Questions
.PP
At the moment, MACA is just an idea. Much simulation and experimental
work needs to be done to answer many questions about how well it will
really work. Here are just some of the questions that can be asked.
How much of the savings from avoided collisions in MACA is spent on
RTS/CTS overhead given typical modem turnaround times and data packet
sizes? How much better does power-controlled MACA perform than the
basic MACA scheme? How about a partial implementation of power
control, e.g., one that relies on trial-and-error instead of explicit
S-meter feedback? How do the various forms of MACA behave as modem
capture ratios change? How serious is the problem of interference from
stations just below threshold?
And how does MACA compare in overall spectral
efficiency with other improved multiple access methods, such as
conventional CSMA or CSMA/CD operation through full duplex repeaters? I
invite anyone interested in pursuing these topics to contact me.

I notice that the moment I mention 'token based' systems, everyone
assumes I meant 'Token-ring'. You can have token-based systems based
on any topology (not necessarily a ring - there are token-buses too!)
Also, someone raised the point of 'how would an unconnected station join in?'.
Well, precisely! Thats half the point. There are many scenarios where
you do not *want* another station to join in! (forwarding or a congested channel
for example; that person joining may collapse the WHOLE system for everyone else
so maybe they should be made to wait till someone drops out and an 'invitation
to join' frame can be sent from the master station?)
The big advantage with a token-based system is that it can be controlled;
nobody speaks until spoken to, so you can limit numbers of connects.
Remember we have in most cases a half-duplex system; a centrally
controlled 'polled' system (think of it as being like a multidrop halfduplex
SDLC circuit) can make some attempt at guaranteeing response times by
using a deterministic algorithm; the current CSMA/CD system cannot
make any such guarantee; particularly at times of high congestion
(like when there are 30 or 40 stations all doing mailbox access on one
1200-baud channel) the CSMA/CD system collapses because everyone shouts
at once and so nobody is heard. Allocation by decibel-count is crude; we can do
better!
Question: Is it better to guarantee a service level to an existing group
by temporarily denying others access, or should anyone be allowed in
irrespective of current loading, even if they crash the system for the

rest of the users?
And has anyone actually analysed working strategies? (for example, I tend to compile mail messages offline, then connect to the mailbox and do an ASCII file send, then disconnect again, so keeping my connect times short and allowing others to use the slot; is this better than connecting and typing the message a line at a time? When I want net bandwidth I want lots of it for maybe 5 minutes, as opposed to little of it for, maybe, the hour it took to compose the messages. Which is best? I guess it might depend on the loading at the time (which varies..!)).

See the (up coming) 9th CNC proceedings. Two papers were submitted which indirectly deal with some of these issues, along with proposed solutions.

In the analysis done on *one* polling scheme, we learned that overall throughput does go up, but individual latency degrades *very* quickly and very badly.

However, I must point out that our goal wasn't to implement a polling scheme. We ended up with polling because we wanted to implemement point to point RF. Point to Point RF is a little hard to organize and get going initially, so we settled on a the NBFM rpt model on a *small* scale. Our thoughts are along the lines of a hubmaster with an omni antenna, and cluster members using YAGI

or some other style directional antenna pointing at the hubmaster.

Since secondaries can't hear each other, and the master is HD, we
ended up using polling.

   The intent of providing the ability to read back the pins is for
self-test; I get the impression this includes testing the attached cable
and printer for shorts. It would be inappropriate and incompatible with the
IBM 'standard' not to implement the port this way.

  As for high integrated PCs, I'm a little concerned about the implementation
of the port, also (I was hesitant to post this in the first place). I would
suggest anybody considering method investigate the port; and consider an

alternative -- lifting the /OE pin of the 'LS374 and attaching it to an
I/O port pin somewhere else (I haven't researched this) to allow disabling
the output drivers. This doesn't help you if the 'LS374 has been sucked into
an ASIC :-)

[BTW - Henry, is there a newsgroup you DON'T read? Do you hire people to
  screen stuff for you? Are you actually a committee of people? :-)]

If you direct FSK the radio, it will need a flat phase bandpass out to
about 6Mhz (just approx, somebody else can do the math:-)) on
transmit and receive. This probably isn't hard for transmit, but
receive would be tough with conventional radios. You really need
a purpose built radio to do this right. Signal to noise ratio degrades
rapidly with increasing bandwidth so high power and short range
compared to FM voice would be the order of the day. Finding 12 Mhz for a
duplex channel on 440 would require drastically rewriting the bandplan.

Work is being done on T1 rates over microwave links. Bdale has mentioned
this before and even showed some hardware at Dayton.

>Also has anyone tried a direct digital to radio interface (without

>By changing the deviation swing for higher bandwidth, might it
>be acceptable, and then connect this to the aforementioned system?

GLB tried this with their 19.2kb digital radios. There are severe
problems with this approach. Some of the problems are; excessive
bandwidth per baud, the signal has a major dc component making AFC
difficult, temperature drift without workable AFC becomes a serious
problem, poor signal to noise ratio due to excessive bandwidth and
poor frequency control. The Grapes 56kb modem uses QPSK for 4 bits
per hertz and minimum shift keying to hold down bandwidth. With a
data randomizer, there is no dc component and the tracking data
detector can handle up to 20khz drift. This modem is basically
a purpose built radio for data, it's input and output are at 29Mhz
allowing a transverter to place it on any VHF/UHF band. The design
is scalable to higher baudrates with faster A/D converters and
waveform lookup ROMS.

Hi,
I read some where that there was a TCP newsletter available, but have not
been able to find a pointer in the right direction to order it.
If anyone would be so kind to let me know what would be available...
Also is there a TCP mailing list on Usenet?
Thanks

I was thinking about the NEDA backbone network the other day. Then
I also recalled about the other networks (some were discussed at Dayton).
I guess there's lots I don't understand yet. In all the discussions
here , I don't seem to recall any discussions about T1 carrier, etc.
As far As I can tell the Backbone networks are pretty well single
point interconnects using 9600 (1200-56kb)baud on 220 or 440 and the like.
Having heard that ISDN is nearing it's implementation stage (at least
around here), and knowing that T1 is used to tie ethernet networks
together between buildings across town, I have to start asking myself
about the feasiblity of use. From What I recall a T1 interface is pretty
easy to build and I don't remember it being that expensive, actually
I thought the parts were reasonable in price.
That brings ne to wondering what it would take to interface a
xtal two-way radio to the t1 parts (directly) and make it work.

I know that it's used to microwave, but why can't it be used on
a commercial 440 rig that's modified similiar to the Texas
backbone at 56kb?
Why not do what ISDN is doing and split up the t1 microwave 24
channel between major cities to small 2or 4 channel or even
single channel feeds on standard commercial UHF radios?
If I understand this correctly a ISDN 'B' connection
can handle 1 9600 digital port and (as in at the same time) 2
voice grade lines. It would seem to me that a full duplex
(split channel) connection should not be too difficult to put together.
We could then by using this scheme,
interface and interconnect our voice repeaters as well as send mail
traffic (ftp etc) between our major cities (or hill tops).

I know I'm probably just dreaming, but I'm wondering why there's been
no discussion about this approach coupled with the basic networking
schemes to get from the backbone to my house?

Also has anyone tried a direct digital to radio interface (without
modem)? By using a carrier(rf) detect circuit to qualify the data
on the reciever and then send a preamble (like in a floppy system
format or rs232 asynch) so that the decodeing system can qualify the
data, shouldn't it be possible to achieve fairly decent throughput?
By changing the deviation swing for higher bandwidth, might it
be acceptable, and then connect this to the aforementioned system?

Good God, maybe I should have stayed on vacation a little longer,
I may still not be back to normal....

>a commercial 440 rig that's modified similiar to the Texas
>backbone at 56kb?

Actually, the TexNet backbone is 9600 baud links on modified commercial UHF radios using FSK modulation. The 56kb modems you hear about are a custom RF modem design by WA4DSY, that uses linear transverter elements to get to/from the 70cm or whatever bands... it is *not* compatible with existing radios.

>I know I'm probably just dreaming, but I'm wondering why there's been
>no discussion about this approach coupled with the basic networking
>schemes to get from the backbone to my house?

There has been considerable discussion about running megabit datarates on amateur radio links. Look at the 12/89 (I think) issue of Ham Radio for the article by N6GN and N6RCE, the 10/89 issue of 73 for an article by N3EUA, at the most recent and upcoming ARRL conference proceedings, and at my columns in the last handful of TAPR Packet Status Registers...

The info is there. People are working on faster links. Very little is on the air right now

Unfortunately, unless there is software that actually uses that self-test capability and will notice if it goes away -- possible, but it's not something most people run often -- then if it ends up saving five cents

under some set of assumptions, somebody will have done it.

Unless you do have a central site, to which the token must always be
returned after one transmission (so that it can be recovered quickly
if lost, by a timeout at that central site), lost tokens make hash of
the "guaranteed" response time of token-based schemes.

Re. 'bidirectional' printer ports on IBM's

The 'standard' IBM printer adapter does support reading of the
data pins on the printer port but the IBM documentation also
warns against an external device driving them. On the other
hand many people seem to use the printer port for input and
get away with it. I'm fairly sure that they aren't all using
the control lines to pass data!

Some of the 'integrated' chips used for the parallel (and serial
and ...) port in newer clones provide a pin that controls the 'direction'
of the printer port. The IBM PS2 adapter defines a bit in the control
register to do this. But all this is hardly universal. If the resulting
box is IBM specific then why not design it as an expansion card?
(OK that leaves out MCA (ie. PS2) but surely ISA based clones are going
to be more common for sometime to come?)

This suggestion has come up before on this group.
Has anyone (who reads this group of course :-) got any experince
writing software to use an IBM printer port bidirectionally?
Do printer ports on other machines work bidirectionally?

Dave Lapp
lapp@hppad.waterloo.hp.com

The above thoughts all came out of my head through my fingers -
they are all mine - of course i'm giving of them freely...

9600 BAUD (BPS) FAX TEST RESULTS

Conducted between WB8WKA (NOS TCP/IP) and WA8OOH (MSYS v1.08)

(Please reference my earlier posting "9600 baud FAX MODEM" for a more detailed description of the circuit.)

Between 7/25/90 and 8/6/90, the amateur radio stations of WB8WKA and WA8OOH tested a "V.29 FAX modem" chip, the YAMAHA 7109, between there respective packet radio stations. Distances involved where about 7-8 miles over urban terrain. Results where quite positive with respect to the performance of the radio link. Equipment and power levels used at each station follow:

RADIO EQUIPMENT:

WA8OOH	WB8WKA
Livonia MI	Farmington MI
ICOM28A (5 watts)	KENWOOD 7950+amp (160watts)
MFJ 1270 TNC	GLB TNC2A
MSYS V1.08 on IBM AT	NOS on IBM AT

Additional radios where also tested. At WA8OOH, good results where also obtained with a 215 Kenwood HT at 200-300 milliwatts. A Kenwood 7730 was also tested with very poor results. Past experience with this radio and the failure of any PL to function correctly on it may need further investigation.

At WB8WKA, tests where also run at power levels less then 160 watts with excellent results, but due to the sharing of the radio with one of the Detroit/Windsor TCP/IP lan's, running lower power full time was not practical. In addition, a ICOM 2AT was tested at 100mw with excellent results.

Signal strengths at both stations where full scale, even at lower power levels. Antennas used at WB8WKA consisted of a AEA ISOPOLE at 50' while at WA8OOH we had a Hustler G7 at 20 feet. All tests where conducted on

2 meters.

THROUGHPUT:

As was to be expected, throughput took a dramatic step up. About one megabyte of files where moved via tcp/ip, with the throughput hovering around 100 bytes/sec. While this is certainly nowhere near "9600 baud", it was a significant jump over earlier tcp/ip testing at 1200 baud. It is thought that there may be some incompatibilities between msys tcp/ip and net/nos. Tests will be run latter this week between two msys stations to see if this figure can be improved upon.

In AX.25 operations, ("user" to bbs) operation was simply put, a dream. By using the "XF" command in msys, full packets where transferred. Setting "X22" allowed a full screen to be transferred at a time. Throughput was about 1 page a second, which worked out to be about 6000-8000 bits per second. From a "user" perspective (I was the user in this case) it made operating the bbs much more enjoyable. As many of our LAN's in the southeastern MI area our crowded, the additional speed did not go to waste.

If I may quote WA4DSY, "Oh where oh where is my HIGH SPEED DIGITAL"? What this means of course, is that we where not able to fully exercise the modems due to MSYS and/or our TNC's not being able to go beyond 9600 baud. The tnc's where modified for 19200 baud operations but we experienced dropped characters. In any type of KISS operation, it is important for maximum throughput, that your DATA link (async link) be at least twice as fast as your radio link. As we where not able to achieve this, then our hope is that much faster throughput can be obtained.

GENERAL IMPRESSIONS:

Audio setup is much more critical. Tones will tend to sound undermodulated. In addition to audio setup, a "keyup delay" circuit must be setup as well. This is due to the fact that these modems send a "training sequence" upon keyup. This must be held off until the radio is fully keyed up. (generally 100-200ms) Once these parameters are set up, things seem to be fairly stable and the modems can be relied upon in day to day operations.

IMPROVEMENTS:

A easier method for tuneup needs to be developed. If possible, mounting inside the TNC would also help. Current carrier detect in YAMAHA chip is useless. Have been unable to get state machine DCD to work on this chip but it is what is needed. Current layout use's +-5V, this needs to go. Must run on only +5V. Also will add programming header and mode select DIP switch.

Existing PC (a carbon copy of the PRUG circuit board) needs to be improved. Quite a bit of digital noise exists on this chip and a re-layout of the PC board would help greatly.

THOUGHTS:

While my original idea of the use of this modem was "networking", more and more I am beginning to feel this will be the next step for the end user. In many applications such as the DX cluster, TCP/IP and bbs operation, increase of speed on the user LAN is becoming more important. While this modem should be a fine performer on our "network backbones", the ease of implementation and the fact that IT CAN BE USED ON EXISTING RADIOS UNMODIFIED should be quite appealing for the amateur that wishes to increase LAN throughput.

WHATS NEXT:

In the next week or two, I need to re-layout out the circuit board to include the improvements I have found. In addition, I DESPERATELY need schematics for TNC's. I have schematics so far for the TNC1, TNC2, PK232 and DRSI. If you have schematics for any *other* tnc, PLEASE send me a copy to the address below:

Jeff King WB8WKA
22816 Maple Ave
Farmington, MI 48336.

Also, if you would like copies of the article describing this chip, please send a SASE to me at the above address.

BETA TEST:

So far, about 16 people have expressed interest in participating in a beta test of this modem. What this basically means, is that we will all get together and make a group buy of parts and such to reduce our costs. In addition of course to the sharing of information that a beta test implies. With a professionally done PC board and all parts I expect costs to be on the order of 60-70 dollars. This is of course assuming we can get a decent discount of the YM7109 (fax chip) as it alone goes for $55!!

>
>-Mike K3MC

Mike is correct. The A/D D/A thing was a typo. QPSK is the wrong term,
the modem shifts 90 degrees for each bit time. The signal constellation
looks like a diamond inscribed in a circle with four points. At the
risk of using the wrong terms again :-(, the modem "carrier" is
14,000 hertz and is shifted plus or minus 90 degrees for each zero
or one in the data stream. According to the manual, the modulation
method is called bandwidth limited MSK which has a -26db bandwidth
of 1.25hz/baud or 70khz for 56kb. The waveform has a 3.5db amplitude
variation designed to eliminate unwanted sidebands.

The scrambler, in Dale's words, "makes the RF spectrum look and sound
like band limited white noise". In other words, the RF energy is
spread evenly over the bandpass and shows no single frequency spectral
lines regardless of the data being transmitted. This makes the tracking
data detector and clock recovery circuits work better because there
is no DC component. It also means that adjacent channels would, at
worst, see only a slight increase in the noise floor rather than
assorted squeaks and squawks.

I am no expert in modem theory, I have built two of these modems
and tuned them up. They work as advertised. My personal experience
with them is that they are extremely stable and have required no

tweaks over a two year period in unconditioned locations.

The TAPR PacketRadio is FSK, with a scrambler to remove the DC component.
It reportedly works very well.

The WA4DSY 56k modem uses band limited MSK (Straight MSK is sometimes called
fast FSK, because the data rate is high relative to the bandwidth compared with
traditional FSK). The spectral efficency is approximately 56k bits/sec / 70
kHz = 0.8 bits/sec/Hz. It is definitely NOT QPSK, which transmits 4 states (2
bits) per baud. QPSK is also called 4-PSK. (For comparison, the current crop
of digital satellites use BPSK, also known as 2-PSK, mostly because there is no
amplitude variation in the signal and simple receivers using digital logic can
be built because the signal can be hard limited. But that's a different
story...).

Marc Kaufman, WB6ECE, has designed a modulation EPROM for straight MSK; this

results in a spectral efficency of 56k b/sec / 105 kHz = 0.53 bit/sec/Hz, but with the tradeoff of having a constant envelope; therefore, class C transmit converters be used with his modulation EPROM.

Lastly, there are no A/D converters in the WA4DSY design, only a pair of D/A converters that are used to convert the EPROM numerical values into I and Q channels for modulation. And although I haven't tried it, the specified D/A converters (DAC-08) are supposed to easily work at higher data rates, like 128 kbit/sec.

I know that Phil Karn reviewed this modem for 73 Magazine last year for the special packet issue (the one with the N6GN/N6RCE/N3EUA Microwave Dish on the front cover), and Phil had an excellent summary of how this modem works.

The WA4DSY modem is indeed a nifty design! It has been in existence for nearly 4 years now, available to the ham population from GRAPES. Now, if we could just suck up that random logic into a Xliinx chip or one of the super PALs" that are now appearing, and use some of the Signetics or Plessey chips for a lot of the RF part, and use surface mount technology, that modem could shrink to be maybe 2" x 4" (!).

Lastly, for those of you doing modem design out there, consider using the WA4DSY 17-bit shift register as your scrambler. Dale, WA4DSY, told me that there are problems with the (then most common) K9NG scrambler that the DSY scrambler avoided. I don't understand this, maybe Dale or somebody else can explain this!

The New England TCPer is one such newsletter. I probably have an old copy around in postscript if anyone would like a sample issue. The info to subscribe is:

```
 6 ISSUES 1 YR  FOR ONLY$12.00
12 ISSUES 2 YRS FOR ONLY $22.00
18 ISSUES 3 YRS FOR ONLY $32.00

Send to:  The NE TCPer
          252 Stow Rd.
          Harvard, MA
          01451
```

There is a mailing list both is raw and digested form. The info for that is:

> Send Replies or notes for publication to: <TCP-Group@UCSD.Edu>
> Send requests of an administrative nature (addition to, deletion from the distribution list, et al) to: <ListServ@UCSD.Edu>
>
> Archives of past issues of the TCP-Group Digest are available (by FTP only) from UCSD.Edu in directory "mailarchives".

Stattinger's Law: It works better if you plug it in.

```

This is a bit late, but I haven't noticed any replies to this posting.
I was surprised when those results came out, and shortly after they were
published, I had an opportunity to ask Lyle Johnson of TAPR about them.
He said that the author had not used the proper component values in his
XR-2211 test circuit. Instead of duplicating the 2211 modem from the
TNC-2, he had used a circuit from an Exar application note, one which
apparently contained several errors. Lyle was confident that the 2211
modem performance was *not* worse than the 7910 and other single-chip
modems. Subsequent comparative tests by N7CL have borne out this
conclusion.

What exactly is the TAPR DCD modification for the TNC-2? A new filter
circuit? An improved demodulator? New firmware?

I know it lets you run with the squelch open all the time, but I need to
figure out if it is going to be at all useful with a 2400-baud add-on modem.

A technique that works for Token-Bus is for the token passer to listen
for activity from the station he passed it to.

There are two TAPR DCD mods, depending on the demodulator you have. If
you have an XR2211 PLL demod (i.e, a TNC-1 or TNC-2), it's just a shift
in the operating parameters of the 2211 to give a much faster lock time
and a little delay circuit to add some hysteresis. When you install

this in a TNC-2, you also remove a bandpass filter that regrettably had the effect of making the demodulator worse. (The TNC-1 had a better filter - you leave it in place.)

For TNCs with lesser demodulators, such as the 3105, you add a state machine EPROM to change DCD from an energy-detection circuit to a real data detection type.

Both mods allow you to leave the squelch open on your FM receiver, which will often cut your data detect time better than in half. Since a lot of the time, people are running with TXDelay of around 30 or so to allow for the incredibly slow receiver squelches, you can often reduce TXD to 6 or 8 (60 to 80 ms).

Reducing the receiver detect time also reduces the "dead time" - that's the time between when your transmitter gets on the air and when the receiving stations figure out that you are on the air - which greatly reduces the window in which collisions can take place.

By making the DCD actually detect HDLC data instead of energy, you also get many fewer false data detects, and your TNC won't back off in the presence of computer noise, idiots whistling on the channel, touchtone, or RTTY from people with their TNCs in the wrong mode.

The five of the six mountaintop packet nodes that I've installed have the DCD mod in them, in several different brands of TNC-2 clones, and they all work excellently (the sixth runs 4800 bps with a K9NG modem and doesn't need the mod). The MFJ-1278 comes with the mod already installed; as far as I know, that's the only TNC that doesn't need it.

One down side: you can't reduce TXD unless everyone you're going to be talking to has the mods in too - which makes me wonder why so many hams around here will spend hundreds or thousands of dollars setting up a packet station but won't spend ELEVEN DOLLARS to put in the DCD mod kit from TAPR. All I can figure is that they're too old and feeble to work on their own equipment - afraid they might drop the soldering iron in their lap, I guess. Would do them some good, though. Sigh. Lead a horse to water....

For more information, see "Can We Continue to Ignore Level One" by N7CL in the ARRL Computer Networking papers from a couple of years ago.

While it is true that a token passing scheme must accomodate the recovery of a
lost token condition, there is no requirement for a "central site" to monitor
or parcel out the token. An example of a scheme that does not use a central
site is the ANSI/IEEE Standard 802.5 {aka ISO 8802-5} MAC protocol which not
only decentralizes the token monitoring process but provides a robust and rapid
token recovery scheme. There are many others; I refer you to the Cambridge
Ring, and Token Bus (ANSI/IEEE 802.4) for other examples.

I firmly believe this, and it's why we're working hard on speed improvements
in our local groups in Colorado right now, instead of losing too much sleep
over upgrading our stinking 1200 baud wide area links... maybe next year.

No, just one link to a neighbor or a cluster server. Only the server
need have a backbone connection. This is exactly what
we are building right now to prototype a .25 Mbaud network here in
norther California. See the recent QEX/Gateway description of prototype
radio performance.   Parts cost is no more than that of a typical 2M
nbfm radio.
  The high performance solutions (>1-2 Mbps) *will* almost certainly
require dedicated pt-pt hardware, at least 1/user at both user and
server ends. See comment below about co$t.

> Alaska I don't have any near neighbors!) It seems to me the chance of
> finding a clear path and/or frequency for everyone is pretty remote. And
> what about between cities? And who pays for all this stuff?

There is no question that higher performance requires higher quality
links. As the phone company's example shows this may translate to
a number of (hopefully shorter) intermediate hops as part of a backbone
to interconnect separated rural areas. Rural America didn't get
connected to a power grid immediately either...
  Who pays for your local repeater? Around here it is the local club(s).
To be interesting this must includ not only support for local users
but also connections to a backbone. The tremendous advantage of backbone
hardware over a nbfm (omni) station is that you have antenna gain
working for you. There is clear incentive to interconnect local areas
with a backbone and two clubs, each supporting half an interconnecting
backbone, both stand to gain from the connection.

> 2.   Dedicated and permanent communication links, which are also funded
>   by governments. (Some are private or donated.)

I don't think this has to be the case any more than local nbfm repeaters
are funded by governments...

>   for its real-time performance, which is what everybody likes and
> expects. The real-time stuff in TCP/IP is what everybody raves about, but
> I am not sure it can deliver on the promise in the amateur packet radio
> environment.

I don't think it can deliver it immediately to *all* amateurs either. We
do have to start in areas which have sufficient critical mass of
interested (and willing-to-contribute) amateurs. However, I think the
bigger problems are organizational and not technical or even economic,
per se.

>   I have never suggested AX.25 is any kind of solution. My opinion is

I agree. I'm putting together a CNC paper related to physical/link layer
design for optimum use of amateur resources right now. If I get it done,
you can see if it makes sense to you after Sept. 22. However, as Phil (ka9q)
mentioned, TCP isn't the problem, crummy physical/link layer is!
Point-point hardware and supporting protocols are absolutely necessary.

>   What I am suggesting is that everyone better prepare to buy a lot of
> microwave gear to make TCP/IP work properly, in real time. This is not
> necessarily a bad thing, but it isn't trivial either.

It's not a lot! We had better be prepared to build a network interconnected
with point-point and LOS links but THE HARDWARE IS NOT EXPENSIVE or even
particularly difficult.
  There are different potential levels of performance based on the quality
of a link in terms of energy transfer. If you want high speed you have

to be prepared to get KTB + 20 dB (or something) power in your signalling bandwith. If you have long, non-LOS links you will not get this kind of performance. Maybe remote Alaska is not going to be running fast scan digital TV for a while. However, a few inexpensive LOS links may very well serve to connect even remote users at fairly interesting data rates.

The radio side of the 10 GHz data link we showed in Dec. '89 HR Mag actually will run at about 8 Mbps. That for about $100/end in parts, antenna included. Yes 10 hops does divide the effective rate down below 1 MBps, but that is still fast enough for some new and interesting applications, real time.

The intermediate speed solution we are working on has potential for working over limited non-LOS paths. As the phone company hardware shows though, high performance (low downtime, high info bandwidth) demands well controlled (shorter) LOS links.

> What we will actually get (I believe) is a system that will only supports
> real time TCP/IP operations for small areas and some sort of email to patch
> these areas together. I doubt that we will ever achieve enough connectivity
> to allow real time operations over wide geographical and especially rural

> Alaska.

I'm not so pessimistic about the technology. Whether amateurs can cooperate enough to make it happen is another question. I don't think we will have world wide X-windows to every amateur any time soon but a few geostationary satellite transponders might do wonders toward supporting real time, moderate data rate applications across large geographic spans.

> NOTE: Before everyone tries to incinerate me, go back and find all the places
>I said "real time." It is my only real reservation about TCP/IP. Show me how
> we can achieve real time operation over wide areas with it. I'm not writing

> a rural viewpoint).

If a few of us find time to get things written in the midst of trying to get northern California connected at 250 Kbps, we hope to have some related text in the next CNC.

I'm really concerned too, I even have a rural viewpoint (to a degree anyway, Santa Rosa is *not* (yet) part of Si Valley).

Chris Elmquist's question about the legality of 16-point QAM on 440 MHz reminded me of a related question. I read an article about someone who was experimenting with SSB 160 meter earth wave operation (that's right, underground antennas). As I recall, the author mentioned that signals propogated over substantial distances and that the signal to noise ratio was incredibly good.

Ever since, I've been wondering about the possibility of packet operation with QAM on 160 earth wave. With a good enough signal to noise ratio, it should be possible to get at least 4800 BPS without exceding the 300 baud FCC "speed limit."

Would an STA be required to even experiment with this? I'd appreciate any comments on the technical or legal problems I'm likely to run into.

Thanks,

I recently burned the EPROM that comes in the TNC_TNC2 archive. It
is SUPPOSED to allow me to upload intel hex ercords to the TNC-2,
but it does not work. Nor does it echo back all bytes sent to it
on startup.

I'm using an MFJ-1274 - anybody have any thoughts on what the problem
may be? It simply freezes, with both lamps on.

At the risk of stirring things up again (sorry, I'm just catching up on
news from the last few weeks and I missed this)...

In article <22737@shamash.cdc.com>, vtcqa@shamash.cdc.com (VTC) writes:
> I fail to see what the big stink over C64's running TCP is. I think it could
> be done.

It can be done. KB2GZD and I have a working foundation for TCP (meaning
that the foundation is working... not TCP yet). It is receiving and replying
to ARP packets but that is is high as we've gotten. Not because it is too
difficult but because of time constrictions. All of my free time lately
has been going to a BSD port (no, not to the c64) and to programming the
GLB PK1-L TNC for KISS. We could probably have it routing and pinging in
a matter of weeks when we get moving again. Hopefully that will be soon.

> Frankly, if someone comes up with
> a telnet or ftp client, Ill pull mine out of the closet. Be sure to make
> it compatible with Digicomm.

Sorry. We don't have that kind of time (what the hell am I saying? I don't

have any kind of time). We didn't even want to deal with their rs-232 routines, so we've built a small 6551 UART off of the expansion bus. You will have to add this and a KISS TNC to run our stuff. The advantage to having the 6551 is that we think we can push it to 9600 baud. Of course, if someone else would like to add Digicom...

Well, as long as we're on the topic of Internet<->Packet forwarding again, I have a request. I need a volunteer, preferably in the southeast US, to forward some articles from Usenet to Packet during a short time in August. Here's the story.

Starting on 5 August, and continuing through 13-17 August is a bicycle race called the Race Across AMerica (RAAM). The RAAM this year takes the riders from Beaumont, CA through AZ (incl. Flagstaff), UT, CO, NM, TX, LA, MS, AL and finally finishes up in Savannah, GA. I will be in SE GA just prior to the finish & plan to watch some of the finishers arrive in Savannah.

What I need is for someone to forward NEWS items from rec.bike to a packet BBS in SE GA (yet to be named, as I haven't found a good one to sign into yet). This way, I can keep up with the news while I travel (packet portable is great). In addition, anyone who happens to live along the route & would like to report on how the race progresses will be welcome.

Anyway, that's the scoop, any volunteers?

I do not agree. It's certainly not true where I work; almost everyone
has a Sun, Decstation or PC that is connected directly to the local
Ethernet. I'm sure I could point to many other commercial and academic
organizations who have similar setups. It is true that many of our
users use the multiuser systems when they should offload their
operations to their much more cost-effective workstations; as you say,
such operations make very little use of the big multiuser system's
processing power. But this is user inertia, not a fault of the
Internet architecture. And in our case, none of our "big multiuser
systems" are funded by the government.

It was my exposure to the environment I have at work that motivated me
to bring something similar to amateur radio, albeit scaled down to run
on PC hardware that is affordable by individuals.

> My whole point about the terminal server idea is that Internet may be
> more dependant on the few large multiuser systems than we might like to
> believe.

This is simply not true. More than anything else, the Internet has

made possible (and accelerated) the decentralization of computing
power and data storage.

> I am not sure ANY protocol can support a network of 100,000 sparsely
> connected peer nodes (nodes that get turned off a random intervals, no
> less), at least in real time.

The Internet is already estimated to include several hundred thousand
nodes, and it is growing rapidly. If you are referring specifically to
amateur packet radio, where our links are greatly limited in speed and
scope, you may be right. But this can hardly be blamed on the Internet
protocols.

>   Internet may have orignally been intended for radio but what is
> currently installed is absolutely dependant (I believe) on the leased lines
> and microwave relays that are again paid for by various governments.

The Internet spans an extremely wide range of media, ranging from
privately-owned local area Ethernets, token rings and the like up to
shared, long haul point-to-point links. This is precisely what makes
it so successful: because each transmission medium has its own
advantages and disadvantages, no one LAN or WAN technology is always
superior. Yet this collection of disparate LANs and WANs must appear
as one seamless, transparent network in order to be truly useful to
its users. This is precisely what TCP/IP was designed to do.

> I have never suggested AX.25 is any kind of solution. My opinion is
> that the very idea of shared frequency packet was flawed and that
> sharing by contention was even worse.

You and N6GN ought to get along just fine. However, instead of
complaining, he's doing something about it -- he's developing those
nifty low-cost digital microwave radios.

> I said "real time." It is my only real reservation about TCP/IP. Show me
> how we can achieve real time operation over wide areas with it.

You're attacking another straw man here. OBVIOUSLY no protocol,
TCP/IP included, can give you real time service if there are no real
time links over which to run it! My point is that TCP/IP is the best tool
for making the best of the non-real-time links that we do have. And it
provides a stable platform for new real-time services if the links ever
do become available.

I strongly suggest that you read up on the Internet architecture and
get some more experience in using it. An excellent place to start is
the book "Internetworking with TCP/IP: Principles, Protocols and
Architecture" by Douglas Comer. It is published by Prentice Hall and
has ISBN 0-13-470154-2.

> Were they profane? Most were... Did the violate the regs? nope.

Back then, maybe not. Today they could violate the US CODE. I've read,
but forgot where, that section is.

> These "profane" images were encoded, not "encrypted" as clever lines
> of characters. they did not transmit "dirty" words, so they were ok. I never
> heard a case where anyone was told otherwise.

Before the "sexual revolution" a little bit of this was healthy and people
just accepted it. Today there is so much we have people fighting against
it, and they go crazy with everything.

> A major magazine publisher brought up the point that hams should now be

> It is data, nothing more. The intention is met.

You and I actually agree on the intent, but not on how law works. Since the
intention is not codified, you will have to bring it up as an argument in
your hearing. Maybe the judge will accept it. Maybe he will buy the OTHER

side's version of "intent". Hopefully no one will complain, and the FCC is too busy to chase it.

> An hdlc frame is encoded. I view uuencode, and file compression the same way.

That depends. I see the "dirty" words as a problem.

> I don't see how we can prohibit this, yet allow the things that are said on
> 75, 20, and 2 meters all the time.

That is the difference between what is law and what is enforced. Clearly, enforcement has a major problem.

> I believe the intention of the reg, was that a listener on that frequency

> games at will, having lots of lewd/"dirty" discussion, with nary a
> prohibited word. If we are going to deal with "intent" rather then the
> word itself, then SOB, darnit, shoot, etc will all have to go.

Maybe I need to find that section of the US CODE and quote it on the net.
It might SCARE you on what CAN be enforced. We are talking about MORE
than just 7 words.

> I would view batched, compressed usenet feeds in the same light. I would

We can ask Congress to prohibit "AX.25" over all broadcast media. That should get the point across. :-)

When I wrote this code eons ago, I did it to give me a way to test kiss code
without burning an eprom every time. Therefore, this code is quite quick
and dirty. It does work, though! As I recall, if you type Control-E the
codes prints out a version banner at you. This was handy because it made
sure that you had the correct baud rate. It also assumes 8 bits no parity.
Also, as I recall, it does not check the checksum byte on Intel .hex file
downloads, because I couldn't figure out what to do when such an error
happened!

I believe the source code is in the same archive. You can look at that to see
what it does in detail.

I just got a call from Terry Northup, the editor of the now-defunct HAM
RADIO magazine. She says:

(1) 3 of the articles in the July issue of CQ were in fact originally
accepted by HAM RADIO;

(2) the HAM RADIO presence in CQ is going to increase considerably;
there will be more technical items, and they will even go through the
HAM RADIO editorial office in New Hampshire, which will remain open.

Hmmm, could we persuade 'em to start their magazine back up, before it
dies out completely? It seems to be lingering...

Chris--

Forgive me if I'm repeating what I said a few postings ago; I can't
remember exactly where this discussion started. :-)

Anway, if I didn't make it clear before, let me do it now. Doug Thom's
callsign server IS available via both TCP/IP and AX.25. TCP users simply
type "%finger callsign@n6oyu". AX.25 users do a normal connect to N6OYU,

then use the inquire command: "i callsign". No special software is
required by either set of users.

You could contact him (thom@apple.com) to find out more about the C
code that parses the incoming request and sends it out the AppleTalk
link to the machine holding the database. (Instead of doing a lookup
on the host machine itself, as a normal finger command would do.)
Although Doug has his system trained to speak AppleTalk and go to
another machine to grab the information, I expect you could adapt it
for whatever situation you have.

Patty

    How about this for a commercial application: I sometimes work in a
lawyers office which consists of a several dozen Suns. The sight of
all those Sun 2s with legal documents on their screens is a sight to
behold. It is also much more fun than all dull PCs running
Wordimperfect which is what most ambulance chasers use.

Gee, I have seen alot of postings where people bitch about learning
the code to get a ticket. It makes me think back to when I went to
night school to get my ticket when I was eleven. The instructor was
Bob Schoeing, W0BE, and he had the whole class doing code in 7
days ! (!!!!). It worked on phoenetics. I have lost the entire alphabet,
and would like to get it, since I have bragged to a few people that I will
have them pass the code test in 2 weeks (like Bob had us do). If you know
what this is, you might have the whole alphabet - PLEASE send it to me:

L Liberia
O Old Crow Booze
H Hit it a bit
A about
V victory vee
B badminton set

Thats all I remember - Bob had the whole class doing 3 WPM after 2 classes
with this system, including numbers and punctuation. (I was shocked)

If you can complete the list or have a different one, PLEASE get it to me
somehow. It would be greatly appreciated.

Thanks in advance !

Jeff - NR0D

Been having this problem with my packet setup: During the summer,
during wet weather, my ability to get a reliable connection to my home
BBS (KD6TH) gets bad. I used to use an antenna in the attic, but since
replaced that with one mounted on a mast above the roof. That helped
much. (the attic antenna was useless in all summer weather, though in
other seasons it worked fine). The roof antenna works good in dry
weather, but we had several days of rain here, and the quality went
poor. Dry weather returned, and it got better. Question is: Is the
attenuation of wet tree leaves significant at 145Mhz? Lot more than
the same trees dry? And without leaves (ie, winter)? I thought this
sort of thing was only significant up in the microwave freqs.

No, I don't think that water is getting into the coax (that wouldn't explain
the attic antenna performance). Or maybe I'm at the point where a dB
difference makes or breakes it. (2m FM packet).

Isn't the current estimate for the number of connected nodes on the Internet
around 100K already? The NSFnet backbone bandwidth is increasing fast enough
to handle another 100K nodes if need be.

>   Internet may have orignally been intended for radio but what is

Yes, the Internet, as a specific functional model defined by the current
group of connected national and regional networks, is heavily dependent
on leased lines and PTP links. That does not mean that the internet MODEL
is.

>   To summarize my argument, I claim (am afraid) that the Internet

>1.   Large multiuser computers, which are paid for by various government
>   agencies. (A few are also privately owned.)
>2.   Dedicated and permanent communication links, which are also funded
>   by governments. (Some are private or donated.)

OK, I'm nitpicking over terminology here ... the Internet (capital I) is
a production networks that exists to support reaearch (in theory at least :-)
The environment used by these researchers leans towards big mainframes
for the most part, although that is changing. How the network is used
doesn't have much bearing (in this case, anyway) on how the network is
capable of being used in a different environment. AMPRnet, by its very
nature, will not look a lot like the Internet, since the model of large
mainframes accessed by many users is not applicable to the end user
applications that will be running over it. Instead, you will find a
much more distributed environment. How we use the network at the
applications layer doesn't change the fact that TCP/IP is still an
excellent choice for the transport layer of the network (AMPRnet).

Be wary of hooking to the +12V DC rail in a automotives electrical
system. The gotcha is load dump. With a very heavy discharged battery,
the alternator will be putting out plenty of current. If you hit a bump
and the battery cable jumps around, you'll see the output dumped back
into the +12VDC rail. Of course, the regulator will dampen the voltage
swing, but it's feedback has a slow time constant compared to that of
the silicon in a PC.

YES! Rainwater coating the leaves and the bark of trees is slightly
conductive. Further, the length of branches and leaves is comparable
to a wavelength at VHF. VHF E-M waves passing "through" a wet tree
will be very slightly attenuated, and they will surely be knocked down
quite a bit if several wet trees are along your radio link path.

The effect becomes quite pronounced at higher frequencies, such that
at frequencies of 1 GHz and higher, leaves (wet or dry) are opaque.

Another note: Acid rain has higher conductivity than "clean" rain, and
contributes even more to the attenuation.

I just thought someone would be interested....

I recently (this past Saturday) saw my first Kantronix Data Engine.... It looks very nice... good construction.... and Kantronix is promising full documentation as they hope it will become a popular "open architechure" standard.

The most interesting thing about the demo was that they had their 9600 baud modem installed, and were demonstrating its use (I believe they said it was based on the G3RUH design). Will this be the first company to have mass produced 9600 baud TNC SYSTEMS available to the average ham packeteer??

They were using the Kantronix DVR-2-2 radios (what else?), and they promised "plug&play" (oh no.... 9600 baud apliance operators)!!!

Well, I was impressed, the system looks flexible, and complete. If they could just get the system price down to $50.00!!! :-)

Rich

RE: DSP Mania and books on the subject

Howdy:

Many people send me notes asking what DSP texts should be considered for an introduction. They always want the impossible however. One that is trivial to understand, does not require mathematics, and tells them how to write V.32 full duplex echo cancelling modems with the fastest Viterbi trellis decoder on the planet or does all the ham radio modes without operator intervention ;-). It should be clear that all these goals are contradictory (I don't want to say mutually exclusive even if I do personally believe this). I have two favorites, which show my bias towards modems.

Theory and Practice of Modem Design by John A.C. Bingham, Wiley-Interscience

and

Digital Communication by Edward Lee and ??? Messerschmidt.

(I can never remember Messerschmidt's first name or initial). I've forgotten the publisher and I left the book at home.

All the other applications that I need to do code for (speech encoders, FFT code, etc.) can be sewn together from the code given away by the chip/board manufacturers. There are no real practical `how to' books that give code examples to aid you in putting together modems that I know of with the single exception of a booklet put out by TI. The individual chip manufacturers run BBS's, have PD libraries with loads of source,etc. and TI has put out a booklet for a 300/1200 bps telephone modem. This booklet has source, little aid in putting it together as a working system, and almost no information on the criteria which went into the modem design. It also uses 1st generation DSP chip technology from TI and a major translation job is required. Motorola has given away source for a V.32 trellis Viterbi decoder for the DSP56001. Not included is the rest of the modem which includes the difficult equalization, near-far echo cancellation, and data aided carrier recovery for the `non-round' constellation. The technical discussion given with the V.32 trellis decoder is appallingly bad. Don't hope to understand what is being done on the basis of what is in this booklet. Having written these decoders for a number of projects (always before in a high level language) I became so confused that I decided to start from scratch, but it is there for the taking. I am certain that I am being thick and just didn't like the exposition. Maybe for you it will all be crystal clear. It can be gotten from any Motorola Semiconductor division outlet from their tech manual/ reference works library. Just walk in grab a plastic bag (paper sack if you are environmentally conscious) and walk out with more books than you can carry. I am sure that TI does the same, I just haven't had the opportunity to do this yet. TAPR and AMSAT are working on DSP hardware for amateur radio modem use and will consist of a TMS320C25 plug in card with 85C30 for protocol work. There is code available from the TAPR AMSAT

project available for anonymous ftp on tomcat.gsfc.nasa.gov. This code
was written for the Delanco Spry TMS320C10 boards we were using at the
time. I am sure it will be translated to the 320C25.

I hope this helps some.

Sounds like someone who hasn't tried it.

||>
||> The drive motors operate off 12V (the car is a little hot for that, but
||> it really *shouldn't* be a problem),

But it is. A very fine EE consultant I know had a lot of trouble
with this, and he only needed +5V. The transients are terrible,
due in part to various inductive loads (for instance, wiper motors).
As an experiment, put a scope on your +12 when you use your horn.

Or consider...

|
|Be wary of hooking to the +12V DC rail in a automotives electrical

|system. The gotcha is load dump. With a very heavy discharged battery,
|the alternator will be putting out plenty of current. If you hit a bump
|and the battery cable jumps around, you'll see the output dumped back
|into the +12VDC rail. Of course, the regulator will dampen the voltage
|swing, but it's feedback has a slow time constant compared to that of
|the silicon in a PC.
|
|N6RCE

As implied by the previous parts of this message you probably will have
big problems. There is tons of noise in a car's electical system,
and the +12V in your computer is used to a regulated source. You'll
need to isolate your computer from the car's electrical system.

If anyone knows a simple and reliable method of doing this, other
than using a seperate battery [:-(] I'd love to hear it.

        HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

 I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07 & 1.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

*** I will also be trying to allow dialup SLIP in the very near future, so users of the KA9Q software can actually use the package to access my system. If anybody is interested in helping me test this option, please let me know...

Yes you have to regulate the 12V supply and the 5V supply.
work engine except for the RF vs COmputer problems.
I have had more problems with the rally computer wiping out
2M frequency then computer failure. There are some minor
adjustments to resolve this problem. The processor reset ciruit
seems to be a real problem if it isn't protect by clamps and
caps. There you are driving down the road, oops miss the turn,
almost stall the engine, and your comupter resets. Well you
obviously left out a MOV in the power circuit, Curtis!.
There are a few special things to do for car applications,
a better case, a better ps (bullet proof), a better pcb (like
a multilayer clone bd), etc.

Good luck, but I know that it can be done, actually I'd recommend
the ampro 86/286 type boards that fit on top of a disk drive....

    I'm surprised your very fine engineer friend had trouble getting a
good +5V from an automotive electrical system. If his current requirements
were moderate, there are 3 pin regulators which work very well under
automotive conditions.

  As for operating a PC from an automotive source, you've got more than
one problem. Getting power is a big one, but providing reasonable shielding
is another, and believe me, this is more important. The PC must be shielded

from electrical noise in the car; this can come in on any cable connected to the computer. The symptoms of insufficient shielding could include erratic operation or a hard failure of the PC (requiring repair). It isn't hard to protect yourself; you may wish to insert 100 ohm/ .001 uF RC networks on all the incoming RS-232 pins, etc.

The power itself is funny. You need to protect against high voltage transients, the voltage may run 100V+ during a load dump. You also may experience negative transients on the power rail. Voltage on the rail will range from 8V while cranking the starter to 15V+ while running at high RPM.

Deriving a clean 5V supply is pretty straightforward under these conditions, but the other (-5, +12, -12) voltages you may need are not as easy. I'd suggest one of two approaches:

1. Build a clean +5V supply and derive other voltages from this source using DC-DC converters. If the current requirements on the other supplies are moderately low, this may work well. I'm not sure how much current you want from the +12V supply; hard disks have historically consumed significant current during startup. Even floppy drives get hungry. The usefulness of this approach depends on your configuration.

2. Build a DC-DC switching supply which runs of the filtered automotive rail and produces all of the voltages. This may be your best bet if you want good +12V current. The downside is you'll probably have to design and roll your own on this, even so far as winding your own power transformer(s). Amidon Associates in North Hollywood sells very useful cores (toroidal and E-type) and offers a fair amount of data on this. I'd also suggest looking at some of the power MOSFET literature in power conversion; essentially, build a PC power supply that uses 8-12V in rather than 160VDC rectified line current.

Enjoy.

Well, I have one of those $25-at-the-swapmeet XT clones running just fine off 12v. Turns out the -5 isn't used at all, and the -12 is used only for the RS232 drivers on the serial port, which in violation of all standards works just fine if you tie it to ground - seems a lot of RS232 line receivers just don't care very much. At least, it talks to my loran receiver's serial port. Perhaps a printer might care more.

The automotive +12 (actually, about 13.5) comes in through a hulking great choke I stole out of an old car radio, then several thousand uF and a 16v MOV to ground, then into a 3-terminal regulator which gives me about 12v when the battery is topped up, a little less when the headlights are on. The floppy and RS232 don't seem to care. The output of the choke also goes into a pass transistor (actually, two in parallel) driven off a three-terminal regulator to give me about 10 amps of +5, which turns out to be more than I really need. PWROK is driven by a 555 timer.

It works. A scope shows the 50+v spikes during engine cranking to hit about +18v or so after the choke; that's well within the 37v max of the regulators. The input voltage drops to about 8v or so during cranking; the processor continues to run but the floppy drive looses speed and gets errors. I haven't tried a hard drive yet.

Dear OM,
In JA , It seems many Mail boxes that used W0RLI/WA7MBL type have changed

to TCP/IP station . But , most users used 8-bit(i,e,Z80) cannot read from TCP/IP , and removed network . It remains now , some pakctters hate TCP/IP .
     I know TCP/IP is exactry good for networking , but cannot this technology support 'all packetters' ? I think packet radio became very popular because of easyily of cannecting Rig , and Computers against to Rtty or Amtor .
     Please show me how you solve this probrem against JA .
     Thank you .

I recently experimented a bit to test the tolerance of RS232 receivers. A TTL low (~ 0.4V) seems to work fine in practice, but there's very little noise margin, as I discovered by loading the driver. A CMOS driver that goes closer to ground seemed pretty bullet-proof. On a small sample, the 1489 receiver did somewhat better than the MAX232 with these marginal levels.

You need to use either a 2764 or the top 8k of a 27256, if I remember
correctly. This was to allow the code to ignore JMP6. It's been a while
though, so I may have this fuzzed...

I have an original TNC-1 and am considering runnning it at a higher clock
speed in KISS mode. Is there any advantage to be gained by doing this? Does
it for example process packets any faster thus reducing txdelay requirements
of the 'other' station?

I've already tried moving JP7 and that didn't seem to work. I know, the
manual says you need higher-speed components but I wanted to see if it would
take it anyway. Just which components in the TNC-1 are clock-speed sensitive?
The manual doesn't say. Are there any special adjustments that need to be
done when I run it at the higher speed?

Then I suppose this aspect of Tex-net is patterned after Internet?
Tex-net allows users to route throughout the Tex-net network without
knowing specific routing (as I understand it, anyway).
The point I was trying to make is: this ain't nothin' new!

>
>Want to work on soemthing truely interesting: What happens when the
>whole of packet radio is pt-to-pt?
 ^^^^^
I agree, sorta. A good point-to-point packet system will be nifty for
many things. But for _all_ of packet???   I really hope not.
In order to make advances, we need the freedom to experiment,
and just plain old dork around with stuff that hits our fancy at a
particular time and place. If the WHOLE of packet is thus restricted,
it'll never progress. Let me try the stupid idiot stuff I've got in
my meshuginer head. What is it going to hurt?

(Hope I didn't take you out of context??? But it is a point that needs
discussion anyway .....)

There are those that would abolish amateur tcp/ip because their view of packet is restricted to the present-day. "Your dumb tcp/ip has long headers. It bogs down the 110 baud link in Oshkosh... and who died and left YOU boss anyway?..... I've been passing traffic for 1E06 years, and we've always ......", etc.

Many speak eloquently of "freedom of speech" (I call it "freedom to flush their toilet-mouth", so you know where I stand ;-), but the freedom to experiment is MUCH more important than someone being able to cuss and be rude in \public :-) I've seen a tremendous emphasis placed (locally, at least) on certain peoples idea of a network, that encompasses ALL of the currently available 2 meter frequencies. Right or wrong, if it stifles the inventiveness that's already in short supply, it's categorically BAD! We need to really be cautious about dogmaticisms, and try to give encouragement to those taking the lead in development of new, untried, and underimplemented technologies.

I appreciate your input and opinions. Thanks for the reply.

I can't speak to the Pac-com PSK modem, but I have one of the TAPR PSK modems connected to my R-7000 and it's working just great.

The trick is that the up/down outputs of the PSK modem can be made available as uncommitted transistors - and you can use those to bridge

the two row and one column inputs on the command scan matrix inside the radio. The service manual clearly shows which pins on the connector for the remote control module are used for these functions.

What I did was to run a piece of cable into the R-7000 to pick up ground, recorder audio, and the three wires needed to run the receiver up or down. The other end of the cable goes to the 5-pin DIN connector that plugs into the modem.

With the receiver set for 100 Hz dial steps, it tracks all the microsats and FO-20 just fine. You will need a preamp; with a 40-element KLM beam tracking the microsats the internal noise and numbness of the R-7000 doesn't let you use low-angle passes. However, the $18 GaAs-FET preamp from Hamtronics works well - stick it in a Pomona box and put it in the antenna line to the R-7000, and you might well be able to hear the microsats from horizon to horizon. I do.

Has anyone modified an ICOM IC-R7000 to track the Doppler shifts of satellites? I am interested in interfacing the PacComm PSK-1 modem to the R7000 to automatically follow the frequency shifts of the Microsats. Unfortunately, unlike with transceivers, there is no direct up/down frequency control of the R7000 except via the remote controller. At the moment I'm looking at connecting the PSK-1's step-up and step-down tuning outputs across the remote controller's frequency up and down switches. A slight problem with this is that the PSK-1's output pulses for shifting the frequency of the radio are only 30 to 40 milliseconds wide and that's not long enough for the remote controller to generate the signal for the R7000 to change frequency. This means that a pulse stretcher will be necessary between the PSK-1 and the remote controller. I'll probably go ahead and build a one or two chip circuit to do this, but I was wondering if there's an alternative approach to interfacing the PSK-1 to the R7000. Any ideas?

>Then I suppose this aspect of Tex-net is patterned after Internet?
>Tex-net allows users to route throughout the Tex-net network without
>knowing specific routing (as I understand it, anyway).
>The point I was trying to make is: this ain't nothin' new!

No, but it's amazing how often it's ignored.

TexNet still doesn't match the focus of the Internet model that many of us are hoping comes into common use on packet. TexNet is a good approximation of the way the Internet used to be, when mainframes were king, and a user connected to his favorite machine with a terminal, and then could hit any other machine without knowing the routing. A TexNet user connects to his local node, and can get to any other node without knowing the routing.

The advent of workstations has led to a slight revision of the model, where a given user is *already* on his favorite host, and is really doing a user to user direct connection without knowing the routing, in a computer'ish kind of way. This is the model I'd really like to see. Users with computers communicating with other users with computers. TexNet doesn't do this, as the interface to users or user machines is an AX.25 "terminal node" connection.

Just as the Internet continues to support terminal service on hosts and on specialized terminal servers, packet radio IP will and does today support terminal users both on hosts and with specialized "AX.25 terminal servers", but that is not and should not be the focus. It's a backwards-compatibility issue only.

>the freedom to
>experiment is MUCH more important than someone being able to cuss and be
>rude in \public :-) I've seen a tremendous emphasis placed (locally, at
>least) on certain peoples idea of a network, that encompasses ALL of the
>currently available 2 meter frequencies. Right or wrong, if it stifles
>the inventiveness that's already in short supply, it's categorically BAD!

There are two strongly conflicting issues here. One is that we need to have the freedom to experiment. That is a fundamental truth, to me.

The other is that if we're ever going to have any wide-area high-speed network

to play with, at some point folks are going to have to talk to each other, and agree on some fundamental points. Not the data rate of links, or the protocols to be run, though those are certainly issues that can/should be addressed. I am talking about really fundamental issues, like agreeing to work together to achieve common goals.

The difficulties we face building high-speed packet networks on amateur radio are today much less based in technology than in human social systems.

The consensus seems to be that I was all wet saying that the Internet model was inappropriate for amateur packet radio. Obviously, I just don't know how to use TCP/IP properly. So tell me...

How do I ftp or telnet through a store and forward satellite? Would TCP/IP even work through a store and forward satellite? How about on HF? (also essentially store and forward due to propagation, interference, and low bandwidth.)

These are currently the only packet channels between Alaska and CONUS. It is about 2500 road miles between Fairbanks and CONUS. A terrestrial microwave relay system would require 50 stations if we could manage 50 miles a hop on the average. What is the likelihood of installing and then maintaining such a backbone? (Our 9600 bps intra-state BBS backbone is piggybacked, I understand, on state owned microwave equipment.)

Vast areas of Canada, western U.S., South America, Asia, Australia, Africa etc. have the same problem. High bandwidth backbones don't appear from thin air just because the design requires it. A lot of the world is going to be serviced by store and forward channels for a long time whether we like it or not; my question still unanswered is TCP/IP appropriate for that?

I read recently (IEEE Network I think) that one of the design criteria for ARPANET and hence TCP/IP was 9600 bps effective between any two nodes anywhere on the network. This was accomplished with long haul links at 230 Kbps links (no doubt much faster now). My observations have been that this is barely enough at the best of times and totally inadequate during the business day. What kind of radio network hardware do we need to provide this level of service? With a couple orders of magnitude more nodes and much less reliable long haul links?

I use an AEA PK-232 with my 386, now running SCO UNIX, but I used
XENIX or a couple of years. I use a homebrew program to control my
FT-980 radio and a regular async terminal program for the TNC.
If you or anyone wants more details, let me know.

A sample screen display:

If I understand Phil Munts' argument, the TCP/IP architecture was
primarily designed for use over subnetworks with continuous,
ubiquitous, real time coverage. On the other hand, much of amateur
packet radio uses slow, part-time links that are suitable only for
handling store-and-forward traffic in non-real time.

Fair enough. The Internet protocols WERE originally designed for the
ARPANET, the first packet switching network. ARPANET used government
sponsored links, and sites that were on it enjoyed virtually

continuous connectivity with other sites. And of course TCP/IP and the applications it supports are most "at home" in this kind of world.

But the Internet has grown far beyond the bounds of the original ARPANET (which no longer exists, having been replaced with the NSF Backbone Network). Not all of the links in the current far-flung Internet are dedicated leased lines or highly reliable local area networks. Some are commercial X.25 networks. Others are dialup phone lines. And some are even amateur packet radio paths. In other words, the Internet is no longer based on "continuous duty" facilities, and it hasn't been for some time.

One place where this is especially true is electronic mail. The Internet now reaches many other kinds of electronic mail networks, many of whom do not use TCP/IP. Examples include UUCPNET, BITNET, Compuserve, MCIMail, SPANNet, and even the amateur packet radio BBS network. Now, strictly speaking, you could say that these other networks are not really "on the Internet", because they don't specifically speak TCP and IP. But what does "being on an internet" really mean?

An internet (note lower case 'i') is usually defined as a set of of connected networks that share a common set of upper layer protocols and a global name space even though they may differ widely in their lower layer protocols. What's interesting about Internet mail is that even some networks that don't use TCP/IP have adopted the Internet's electronic mail standards, either as their native tongue or as a lingua franca. In a very real sense, we have built an "inter-internet", and the new "inter-internet datagram" is the electronic mail message. Some people have followed the Internet client/server model even further by setting up "mail archive" servers that accept mail messages requesting files that are automatically sent back in return mail.

To be sure, the facilities of this inter-internet are not as transparent, flexible, or as powerful as those of the "real" Internet, because they are typically built on slower non-real-time facilities that are better suited for store-and-forward traffic such as email. But they work, and they do not deny those to do have the resources to build a "real" TCP/IP Internet the opportunity to do so while retaining the capability to exchange email with those who are not as well endowed.

So, after that lengthy monologue, on to some of Phil's specific questions.

> How do I ftp or telnet through a store and forward satellite?

In theory, you could. You store each IP datagram as a separate message in the satellite. After two passes over the client and one over the server, you've completed your three-way TCP handshake, and now the server's ready to send the FTP greeting....

Ah hem. Obviously, real time services like FTP and Telnet are not

appropriate THROUGH a non-real-time satellite like Microsat. But there's no reason that you couldn't use them to talk TO the satellite, using it as an FTP "staging area". People do the same thing all the time on the ground, especially when their computers have only intermittent connectivity to the Internet (portable laptops, for example).

You might think the use of TCP/IP unnecessary if each user talks directly to the satellite. But the use of TCP/IP on the satellite could make it much easier for the users in a local community to share a common satellite ground station. The TCP "end-points" would be on the satellite at one end, and at the individual user stations at the other. The shared ground station would just be a concentrating IP router/gateway. By the way, there's much to be said for the gateway approach to using satellites, aside from being able to share the cost of the equipment. By funneling the users' uplink packets through a common queue and transmitter, you avoid the contention between them that would otherwise occur if they each transmitted to the satellite directly.

> How about on HF?
> (also essentially store and forward due to propagation, interference, and
> low bandwidth.)

It depends. A satellite can have an onboard computer and memory, while HF is just a propagation channel. If it's available and goes where you want to go, there's no reason it couldn't be used in real time. Otherwise it could be used in store-and-forward mode to handle email or file transfer.

The point I've been trying to make all along is that TCP/IP does NOT necessarily preclude store-and-forward operations or vice versa. The popularity of the MX (mail exchanger) extensions to the domain system prove this. The MX facility has dramatically improved the ability of Internet users to communicate easily and transparently with off-net sites, most of whom are joined only through slow and intermittent store and forward paths -- just like amateur packet radio.

> I read recently (IEEE Network I think) that one of the design criteria
> for ARPANET and hence TCP/IP was 9600 bps effective between any two nodes
> anywhere on the network. This was accomplished with long haul links at 230
> Kbps links (no doubt much faster now).

Actually, the ARPANET backbone links were almost all 56kb/s. This bandwidth had to be shared across all active users. Depending on how many users there are and where they wanted to go, they might or might not receive an effective throughput of 9600 bps. This had nothing to do with the protocols, but with basic arithmetic -- no protocol can cram ten pounds of users into a five pound network.

To be sure, there is still plenty of room for improvement in extending the Internet model to cover less-than-ideal network paths. I believe amateur packet radio has already made some contributions in this area;

a robust round time measurement algorithm that I invented several years ago while trying to get TCP to perform better over amateur packet radio was picked up by the Internet community and is now a required part of the TCP standard. The protocol implementations should also be tuned to accomplish more in fewer round-trip packet exchanges. TCP allows data, acknowledgements and control messages to be piggybacked in the same packet. For example, it's perfectly legal for an FTP server to send its TCP SYN/ACK and initial banner all in the same packet, but few do. Also, it's legal to "batch up" a series of SMTP commands in the same packet in order to minimize the effect of long round trip delays. NN2Z's SMTP sender does this.

We also need to devise application interfaces that are less dependent on real time connectivity. FTP clients (including mine) are a classic example. Why should a user have to sit there and manually log into a remote server and interact with it even when he knows in advance everything he will type? He ought to be able to tell his local machine "get this file from that machine, and use the following user name and password". His machine would then do everything automatically, even if the remote system is momentarily unavailable when the user requests the transaction. Similarly, I should be able to say "send this file to user so-and-so" and have the rest occur automatically. The interactive model has persisted on the Internet largely because there has been little pressing need to fix it. But this doesn't mean that it can't be. This is another way that amateur radio could give something back to the Internet community.

I'm fond of telling non-amateur Internet groups that if we can make TCP/IP work on ham radio, with its unbelievably brain-damaged links, then we can make it work ANYWHERE. And with the phenomenal growth in the Internet (it has been doubling roughly every 12-13 months for the past 5 years) the problems ham radio encounters today could well be those the real Internet will encounter several years in the future. I'd like to think that this helps serve ham radio's reason for being.

Phil

Thought I'd drop off a note to the experts on the net before breaking my
piggy bank to buy a radio. I'm new to this whole thing so...

I just passed by Novice,Tech written and 5 WPM code test. I'll be working
on General, Advanced and 13WPM code test for a test next month (Why stop
at tech ... ?)

In any case, I want to get a 2m/440 or 2m/220 radio. The first problem is
220 vs 440 ? It seems that you can't have everything. Any advice on that ?

With my "zip" experience in owning any 2m equipment I've done a little research
and have come up with, what I think is a good radio...

Its a Kenwood TM-731A 2m/440 dual band, 30 memory channels, extended freq
coverage, programmable scanning, 50 Watts on 2m, 35 Watts on 440, CTCSS,
etc etc. The price on this is (whew) $649.

==> Does anyone have experience with this radio... Or can someone suggest a
==> better rig than this ???

I'm very much intersted in using this for packet. I will shortly be going
through similar buying trauma for a TNC.

==> Any TNC recommendations ? And software that can be used with a Mac ?

I'd like to get good eqipment, with basically everything from the start ..
.. rather than picking up odds and ends along the way. The latter being,
I think, more expensive than the former.

Any and all suggestions welcome.

Thanks much
  Gary Buchholz

Check with the local hams to see where the activity is located. Different areas use their spectrum differently. If really interesting things are happening locally on 220 then go that way. Otherwise go with the 440 equipment.

This is a nice feature packed radio. It does tend to run a bit warm and an external fan might help in some installations. I am personally biased toward Icom radios since I have had very good experiences with them, but the 731 is a very good dual band solution. Yeasu and Icom make very good radios as well and I can recommend the FT4700H or the IC2400. Basically they are all good radios, the primary differences are due to the way features are implemented. You may like the Kenwood way, or the Icom way, or the Yeasu way best based on how you like to operate and how you like to think about how controls should work.

>

I would strongly recomend that you not try to use one radio for both

voice and packet unless economics forces you to. Quite often the ability
to talk over a problem you are having with new packet techniques is
invaluable. In general, a simple cheap used crystal rig will be ideal
for packet. I would recommend the IC22a or the TRC22 or any of a number
of used commercial two-way radios by Motorola or GE. In the new equipment
market, Kantronics makes a nice little crystal rig designed for packet.
As for TNCs, MFJ, Paccomm, Kantronics or AEA, they all work. Get the
cheapest that has a standard TAPR style modem disconnect. Currently I
am using MFJ1270 and Paccomm Tiny 2 units. Red Ryder will get you started
as far as software is concerned. There is also MacPacket and others.
When you are ready for more advanced work, there is the KA9Q TCP/IP package
available with source for the asking.

>I'd like to get good eqipment, with basically everything from the start ..
>.. rather than picking up odds and ends along the way. The latter being,
>I think, more expensive than the former.

This attitude could prove to be disapointing in the long run. Today's
wonder box is tommorrow's worthless clunker. The technology of packet
is changing too rapidly to justify buying one of the current do everything
boxes. They tend to do everything equally poorly. You can add high speed
modems to your plain TNC if that becomes popular in your area. You can
add a really good HF modem to your plain TNC if that becomes your interest.
You can even discard your cheap TNC and get some really good RTTY equipment
if that becomes your interest. The do everything boxes tend to be closed,
and as technology changes, can be very difficult to upgrade. Sort of like
a Mac :-).

At least half the fun of ham radio is the tinkering, modifying, experimenting,
and horse trading involved in getting the "ideal" setup. Don't settle
for applicance operating.

Phil -- Long before there were local area networks there were packet radio

networks. Remember Aloha? Where do you think the name EtherNet came from?

The first internet gateway was a PDP-11 that linked the arpanet to SRI's packet radio net. In those days packet radios took an entire air conditioned van to haul around the PDP-11s, radios, and terminals. The data rates were higher than today's 1200 baud amateur radio, but the notion of linking networks with different packet sizes, transmission rates, and delay characteristics was fundimental to the design of the internet protocols.

Certainly we have learned a great deal since then about the truly pathological cases. We certainly never expected to extend timeouts to the lenghts that are sometimes seen over amateur packet radio or through congested (or sometimes just sick!) gateways.

It would be nice to think that the designers of the internet were able to predict the future. In fact the rise of the LAN was completely unpredicted. Nobody expected workstations on every desk. We expected terminals talking via phone lines, satellite links, and packet radio to central time sharing systems.

*Sb: More TX audio from MFJ1270B/1274

Need more TX audio to drive a commerical radio or inject past the limiter?
The following mod will increase the stock output from a MFJ1270B or 1274
TNC from about 200mv with tone twist to about 500mv with no tone twist.

Change R56 from 7.5K to 4.7K
Jumper out cap C71
Remove cap C73
Install 1mfd caps at C34 and C35 (caps shown on board but missing)

The above changes will make the TNC TX audio the same as the older
MFJ1270 and TAPR TNC2 units.

I am presently using this mod in order to drive Motorola and GE radios
in my node stack.

The Internet community already has a solution to this. Check out BFTP (described in RFC 1068 and available from venera.isi.edu). It works very well from my experience, especially recently (many people have upgraded to new versions of the ftp daemon since the Morris worm).

There are also many sites out there who run 'shadow archives' by contacting the official archive sites via FTP and retrieving all new files; this is also all done automatically without user intervention.

Amateur Radio would be the ultimate stress-testing ground for these systems. But they have already been invented, and there's no sense us re-inventing them.

Improving them, on the other hand, would be worthwhile...

How about using the serial computer interface (ICOM CIV) to step
the frequency up and down. I believe it has such commands. This would
require an interface with a microprocessor (8051 etc) but should be
fairly simple still. The remote control method is bound to be somewhat
unreliable (interference with the beam etc).

Needed: One packet terminal program for the Amiga. I've been using
Online!, NComm, and AZComm, but I have problems with the backspace
embedding characters in the message. Does anyone ahve or know where I may
find a good PD terminal pkg for packet that will overcome these problems? Also,
if you know of any patches for these pgms, I would love to hear about them.
Thanks for any assistance!

From article <1990Jul24.215835.21179@midway.uchicago.edu>, by
gary@ellis.uchicago.edu (gary buchholz):
>
> In any case, I want to get a 2m/440 or 2m/220 radio. The first problem is
> 220 vs 440 ? It seems that you can't have everything. Any advice on that ?

Find a Drake UV-3 at a hamfest or in the Yellow Sheets. It has the
capability of 144, 220, 440 all in one not so small radio. It has
four diode programmable memory channels for each band, and its VFO is not
confined to the standard channel spacing for each band as some of
the newer radios are.

This is the kind of radio with which you could be comfortable for multiband
packet operation; you certainly wouldn't miss it mobile, it's too big!

Just a thought.

I'm curious.

Has anyone ever implemented multi-cast as part of TNC firmware?

For those not familar, multi-cast is the ability for one network interface to respond to a list of addresses. TNCs in KISS mode just hand all data to the host; this is wasteful if the TNC can easily toss out data that isn't intended for the host.

Other kinds of network interfaces (like Ethernet) normally respond only to a unique address and a broadcast address. Most Ethernet interfaces may be programmed to respond to a list of addresses, with certain limitations.

For instance, someone running NET might program their TNC to respond to 1. The station address (KK6JQ-3, for instance), 2. IP broadcast address (QST) 3. NET/ROM broadcast (NODES), 4. (you name some).

For a station which is used mostly for keyboard to keyboard, this could make a 9600 baud host interface useful with a high data rate channel (56 kb?). Even running multiple AX.25 sessions and/or TCP isn't so bad. With a maximum of 7 outstanding frames per AX.25 connection, a practical limit of 10 AX.25 sessions results in a maximum of 70 frames buffered before the "other guy" shuts up and waits, even if it is for just one frame to be removed. TCP set to a window of 432 bytes results in two oustanding frames on each TCP session; this amounts to 2 frames/session, or 40 frames for 20 concurrent sessions. Of course, a user is not limited to 10 AX.25 sessions or 20 TCP connections; exceeding these limits (or some combination of them) simply results in increased possibility of overrun in the TNC. If the TNC dedicates 30k to frame buffers in an efficient manner, 100 buffers is not an unreasonable number.

While the mechanism is a little different, the synchronous nature of the connections would result in an effective persistance of less than 1.0. (essentially, hosts could not introduce traffic to the channel quickly enough to be a channel hog).

I'll address the issue of keyboard/keyboard on a high rate channel in another posting.

Dana,

It's certainly *possible* to add multicast filtering to the KISS TNC,
but at the channel speeds where it would make a difference (i.e., much
faster than 9600bps) you really shouldn't be using external TNCs
anyway.

K3MC and I intended the KISS TNC to be a short term hack to get us
going with TCP/IP until dedicated host interface cards were available.
Unfortunately, in the computer field there seems to be no such thing as
a "short term hack"...

Phil

Summary:

I just finally bought several of the Computer Networking Conference books. These are excellent, much better than I'd expected. I'd HIGHLY recommend going out and buying them.

Anyway, I've heard people complain (myself included) that the Carrier Detect mechanism on the Am7910 is poor, while the XR-2211 is quite a bit better. Of course, using a DPLL/State Machine for coherent data carrier detect is by far the best approach, so it really doesn't matter how poor the carrier detect provided by the demodulator is. What is important, however, is good data recovery in the modem.

What is ironic, is how poor the XR-2211 fares in terms of noise performance. Page 110 of the 6th Computer Network Conference contains LU4DXT's paper on measuring th noise performance of several popular modems. In order to achieve a Bit Error Rate of less than 1e-04, the 2211 requires a S/N of 24.2 dB, while the 7910 requires only 12.3 dB S/N.

A friend of mine wants to connect a homebrew micro to an ethernet lan and was considering using KA9Q for the software. He is looking for a version that will compile and run under CPM. Anyone know where the source code for such a beast exists?

I will be moving to Ann Arbor, MI two weeks from now and will be staying for
about a half year. I am debating whether it would be worth the effort to take
my packet equipment with me. Could anyone near that area fill me in on the
state of packet radio and TCP/IP activity there?

Also looking into continued access to Internet from there so I can get my
e-mail. Anyone know of any kind of dial-up service in Michigan to a Telnet
server?

Phil, KA9Q, writes:

<<K3MC and I intended the KISS TNC to be a short term hack to get us
going with TCP/IP until dedicated host interface cards were available.
Unfortunately, in the computer field there seems to be no such thing as
a "short term hack"...>>

I agree with the status of the KISS TNC to be a stop-gap measure. There is
an interesting implication, however, to the philosophy you mention:
the requirement for dedicated interface cards essentially means that
the use of a PC-Compatible as a host would become mandatory. Even granting
the PC's status as a defacto standard, it is still desireable--in my opinion--
to be inclusive of other computers which have sufficient "horsepower" to
run the networking code (Macs, Amigas, etc.).

Of course, there's always the option to "roll your own" but that significantly
restricts access by adding a filter of technical proficiency.

I'm not arguing against the development of dedicated cards--far from it.
I think it's the best overall solution. I sense a need, however, for a
generic, "low-cost" hardware product that would provide a machine-independent
interface using a standard interface to the host computer. From a purely
economic standpoint, it might be hard to justify (since the cost of used
clones is approaching the cost of today's fancier interface boxes anyway)...
but when you try to sell a newcomer on ham radio, the pitch of "here's
something new you can do with your EXISTING computer" is a powerful one.
I'd hate to condemn them to the same obsolete physical/link layer suite that's
around today...

TCP/IP activity is pretty good; you can dial up a local number and get
access to a piece of the internet (the Merit regional network) tho
not the whole thing. As such there are a bunch of people running KA9Q
who aren't hams.

I'd take the gear with you, i'm pretty sure there's enough traffic here
to warrant it.

No, this does not follow at all. Your host doesn't have to be a PC to
avoid having to use a KISS TNC. It only has to have an HDLC interface. Many
computers with more reasonable hardware architectures than the PC already
have HDLC capability; the Mac is one example. All somebody has to do is
to write the appropriate driver.

I've stuck with the PC mainly because they are too inexpensive to
ignore. But that doesn't mean I won't encourage others to make
effective use of NOS on whatever non-PC computer they have.

I'd like to find out just what kinds of levels of experimentation and
usage is being done with packet radio broken down in the speed ranges.

    1200 baud
    2400 baud
    9600 baud
   19200 baud
      56 K baud
   1.544 M baud
      10 M baud

My current thoughts are to pursue 56 K baud to start out with. It looks
more and more like a TNC based setup is not going to do me much good, so
I'm now back to looking at a PC/clone based setup with high speed modems.

Oh oh, here we go again..........

This came up on the net not too long ago. The answer was NO, and then it
was suggested that people write their own based on Phils software. I just
bought a CPM machine and know nothing about it, nor have I even used it. I
would be interested in getting TCP/IP running on it. As far as I am concerned,
a Z80 beats the hell out of any 80xx CPU. It would probably be kind of fun.

What the hell - if you want to work on TCP/IP for the C64 send me email. It
looks like a project for a small crew of people. Maybe we could start a
mailing list and coordinate things like that.

>If I invest several $K in such a beast, I sure as h*** don't want to ALSO
>have to buy an XT/clone just as an interface.

Indeed this has been a concern of mine lately. I recently bought a used
Sun at an attractive price. I thought about using a Kantronic DE56 as
a frontend for the Sun. But, since I can buy a barebones PC for $299
at the local Clone Emporium, it hardly seems worth the effort to develop
the code. The Sun already has an ethernet interface and tcp/ip so all
I need is a ethernet card for the PC and a DRSI card. Ok, this adds up
to more than a DE56, but I get ethernet speed between the machines and
no need to develop new code.

The major problem with the TNC approach as I see it is the loosely
coupled async link to the PC. This is the performance bottleneck.
Even the Z80 has no trouble keeping up with a 56k HDLC link, but
ask it to also pump a 56k async link and it dies, as does the PC.
We have to either tightly couple the PC using an internal card with DMA,
or use a smarter TNC with a buffered high speed link (ethernet) to the
host. That smarter TNC is most cost effective today as a PC with
interface card and ethernet.

We currently have a need to develop a pure switch that can be controlled
over the landline on a mountaintop. The switch must efficently switch
packets coming in on two 56k links, three 1200 baud links, and a 9600
baud link. Currently we are handling 3 1200 baud links on interrupt
per character from kiss tncs and a single 56k link using our specially
soupped up kiss56 tnc that only feeds the PC at 19.2kb, also interrupt
per character. The switch is controlled by a 2400 baud phone link to
Remote2 also interrupt per character. Not only have we run out of
spare interrupts, but we have also run out of performance. The approach
we are taking to solve this problem is to develop smart cards with
a 64180, ram buffering, and a DMA channel to the PC. This allows
interrupt per packet and greatly offloads the host. The Grace Packet
board could probably also handle our needs, but we don't have one
to experiment with yet.

One criteria for sucessful mountaintop switches is the ability to
be repaired easily, cheaply, and quickly. With lightning as a constant
threat, we don't want to have to wait weeks for a replacement part.

Using cheap commonly available PC clone parts means we don't have
to inventory expensive or hard to get parts to keep our switch running.

A nearly ideal solution to our problems would be a much smarter TNC
with HDLC and ethernet interfaces. We could dedicate a TNC to each
link and tie them together with an ethernet cable to the host doing
the actual routing. A small boot eprom in each TNC could allow them
to download their operating code from the host. This sounds vaguely
like the late lamented NNC with the SCSI chipset replaced by an
Ethernet chipset. Whether this could be developed cheaply enough
to meet our cost goals is unknown. If anyone wants to start producing
these in the $200 range, let me know.

You might also send mail to Manfred Prange (uunet!umich!vela!cetus!prange
I think) or Steve Grevemeyer (grevemey@vela.acs.oakland.edu). They're

both into computers and Ham radio pretty heavily. I think there is some packet radio going on around here, but they would know better.

In reply to my comment about dedicated interface cards, Phil Karn writes:

<<No, this does not follow at all. Your host doesn't have to be a PC to avoid having to use a KISS TNC. It only has to have an HDLC interface. Many computers with more reasonable hardware architectures than the PC already have HDLC capability; the Mac is one example. All somebody has to do is to write the appropriate driver.>>

If you define the KISS TNC's functions to include providing HDLC and a modem only, I agree with you.

Let me suggest a somewhat different perspective. The KISS TNC today has another function: it provides buffering, and isolates the PC-to-TNC data rate from that of the channel. Given today's slow 1200-baud (or even 4800 or 9600) system, you are right to say that there's no good reason not to move the HDLC back into the host and dispense with all but the modem.

When you get to 56kbs and up, however, I suggest that a specialized interface is needed. Within the PC-compatible environment, the best implementation is likely a dedicated DMA card, and it's no big deal to design that card to drive the modem at the channel's data rate. Things are more complicated on some other machines. Having a generic box using a "standard" host interface could be quite useful. What form would it take? Ideally,

it would talk to the host using something like SCSI, running faster than the channel (the future equivalent of hitting a KISS TNC at 9600 while running the channel at 1200). A less-favorable alternative would be a system which interfaced using the PC's maximum RS-232 (or whatever) data rate, buffered the data, and interfaced to the modem at a higher rate. (Clearly, such a system would not allow the user to make full use of the channel bandwidth, but we shouldn't constrain the channel to run at the rate of the slowest PC interface!)

Someone has to write a software driver in any event.

Please remember that I'm *not* arguing in favor of perpetuating KISS TNCs! Far from it. Thinking ahead, I'm concerned about how to drive a moderate-to-high speed channel using a host other than a PC-compatible. I particularly wanted to mention the advantages of having a turnkey solution available for nontechnical newcomers. We should keep it in mind. That's all.

Looks like Gary, KE4ZV, and I think very much alike. With clone PC
hardware being so cheap and readily available, it's hard to get
excited about having to hack direct packet radio support into every
type of personal computer.

This discussion parallels one that has been going on in the regular
Internet world for some time. The consensus is that you should try to
keep host and router (gateway) functions separate. A few dedicated IP
router designs can handle the plethora of subnetwork interfaces, new
routing algorithms, congestion control schemes and network management
functions much more easily than the dozens of general purpose hosts
and operating systems that also have to support user applications.
Very few computers around here support T1 interfaces, but that doesn't
matter because we have one Cisco router that does, and all the hosts
can talk to it over Ethernet.

My only complaint about the PC/XT that I use as an IP router at home
is the noise -- it sure would be nice to find a PC that didn't require
a fan.

For the dedicated network router/interface box approach to work, there
needs to be a standard local interface that is supported by all of the
local machines that want to use it. Various proposals have been made,
including RS-232 and SCSI.

I argue that Ethernet is clearly the way to go here, since it is by
far the most popular local area networking standard. Unlike SCSI it is
designed specifically for networking between separate peer machines
(e.g., Ethernet isolates equipment grounds while SCSI does not) and it
can operate over much longer distances (500m without repeaters) and at
much higher speeds than RS-232. It is already available for almost
every modern personal computer. Even laptops can use Xircom
controllers plugged into their parallel printer ports. Ethernet
boards for the PC are now down to the $100 level, and Ethernet is
already standard equipment on almost every engineering workstation
(some of which will soon start competing directly with 386 systems).

I've been urging those building the "next generation of NNCs" to incorporate
Ethernet into their designs, but so far without luck.

Here are some more tests to help you decide between SCSI and
Ethernet.

(1) Pick up a SCSI cable and a thinwire Ethernet cable. Which would you
rather string around your shack?

(2) Pick up a SCSI cable connecting a Mac to its disk. Pick up another
one connecting your favorite workstation to its external disk. Count the
number of different kinds of connectors you see. (I got 4). Repeat with
a pair of Ethernet cables.

(3) This one is harder to do at home, but I think it's important.
Ethernet has been around for a while. There are very detailed standards
for almost every aspect. While there are the usual number of slipups,
most if not all the major players work *very* hard to conform to them.

==========

I recently picked up a DRSI PCPA. I tried to install it in my 286 clone, but
it would not work ok. I read the manual and it explains how to use debug to
check for a free i/o area.

I tried   -i 300   and should get 'FF' if free. I do not get this. I get the
wrong response on the various areas the manual suggests. I have removed all
boards except the floppy drive controller. I still get the conflict. I have

an eprom programmer. Before I start trying different bios chips, has anyone came across this before. The system board is a 4meg ram 12mhz 286 board. The board is fairly new (less than 2 months old). The bios has built-in diagnostics. I am just guessing that the 'extras' on the bios might be giving me problems.

  I don't know if you caught the thread a while back regarding the issue of a machine independent packet-assembler-disassembler. I'd suggested using a common 'high-end' interface such as SCSI. Time permitting, I've been slowly putting a 9600-56000 baud PAD together which talks to a parallel i/f, initially a PS/2 parallel port (they're designed to be bi-directional), later on a SCSI port. The design goal is a low cost PAD which people could attach to their Macs, Amigas, Suns, RS/6000s or PCs (assuming they've already got a SCSI controller).

   The issue of putting more smarts in a TNC could keep the current generation of 'machine-independent TNCs viable while more permanent solutions are developed. It also has the advantage that a single station would have trouble hogging a channel. Making a TNC smart enough to pre-process packets even when running in KISS mode has some real appeal. The changes could be made in such a manner that a user need only 'pump' the TNC before running NET/NOS, downloading a multi-cast list and other pre-process configuration (such as enabling digipeating of AX.25 frames). NET/NOS would require no changes.

  We DON'T have bus attach PADs for Amigas, Suns or RS/6000s. Consider for a moment the commercial feasibility of developing these things; how many of each one do you think will be sold? On the other hand, a single SCSI attach PAD would work with all of these. If you were a ham radio dealer, what would you prefer to stock?

It is not unusual to see something other than FF at a empty location
on the PC bus because there are no pullups on the PC bus. So don't get
too excited about that. Exactly what symptoms does the DRSI exhibit
that leads you to believe you have a conflict?

A second argument in favor of Phil's claim about ethernet. You can
even get a SCSI based ethernet gateway for your Mac -- kind of the
best of both worlds if you have a Mac Plus like me.

I have a schematic for the Atari ST that allows up to 7 8530 SCC chips
to be wired in, giving 14 additional ports, be they RS232, KISS, or
even TNC2. The driver for this is contained in the PE1CHL version
of net, and will support packet with only a modem - no TNC!

All right! NOW we're getting somewhere. All this RS232 (does RS stand
for Really Slow??? :-), etc., junk is really a dead end hack anyway.
DMA would seem to be the real future of all serious high-speed data
transfer.

> it would talk to the host using something like SCSI, running faster than
> the channel (the future equivalent of hitting a KISS TNC at 9600 while
> running the channel at 1200).

The Atari ST, a _very_ underrated computer, already has a DMA port which
is used as the HD port, and I already have a BMS-100 SCSI adaptor card
for my HD. (also Re: kk6jq's articles on a possible SCSI highspeed hack.)

>   A less-favorable alternative would be a system which interfaced
> using the PC's maximum RS-232 (or whatever) data rate, buffered the

This is what the Kantronics DE56 is attempting to do, more or less.
Yes, it'll probably work fine for now at 1200, and 9600 baud, or
maybe even on a busy 56K channel. But what about on a _real_ man's
1 mB channel, etc.? Considering what's possible with todays technology,
it's quite reasonable to consider 56 kB ham packet as only "medium speed".

> (Clearly, such a system
> would not allow the user to make full use of the channel bandwidth, but we
> shouldn't constrain the channel to run at the rate of the slowest PC
> interface!)

yup - isn't that basically (pun intended) why the C-64 is now obsolete?
This is also one reason those with high IQ's do poorly in public school.
The class is restricted to the speed of the slowest student that learns
what the class teaches. So to school AND packet I say - let's let the
faster ones go at their own pace, and put the slower ones in a special
area where they'll benefit more. (This is a view from the other side
of traditional thinking, which puts "normal" kids at the crux.) (Yes,
I was one of the "gifted" kids, and had a totally boring, miserable
time in grade/high school.)
>
> Someone has to write a software driver in any event.

yup - and this will be the best part! Software is not machine
dependent, i.e., the driver could be written for virtually ANY machine.
>

Good idea. You would've never gotten me into packet with a megabuck pricetag. I groused about $129 for my first MFJ 1274! And I speak for virtually all packeteers. (does 90% count as "virtually all"? :-)

I'm not as concerned about "non-technical newcomers" as you are. I basically feel that the "cutting edge" of technology is no place for the non-technical. I'm sure being an Engineer jades my viewpoint, so take this as intended, with a grain of salt. Also consider: to pass any ham license, one should have a modicum of tech knowledge. This means that some hams we know must be non-legit - but in the immortal words of John Cleese, that's "something completely different".

Ethernet is available for the Amiga 2000/2500/3000 from Commodore. The cost is about $350 retail w/o software. Educational users can do

much better than retail pricing. There are also third party ethernet boards for the Amiga available for similar cost.

My $0.02 on this subject is to agree that ethernet is probably the port of choice for new TNC's, so long as a "fast" serial port is also provided for people who want it. Something like LocalTalk (@ 230.4 kBps) would also be attractive, but this can be done as part of the "fast" serial port almost for free. Note that LocalTalk using phonenet is particularly easy to use & install.

It doesn't. Your friend is more than welcome to grab the source and try to make it work, but I warn you/him that the current executable under DOS, with a code density about twice that of a Z80, is well over 200k... it'll be a tight squeeze, at best.

Cost.... that is LONGTERM COST, was my original reason for not going with the Mac. Seeing ethernet at the $100-200 range for a PC/clone vs. $700 for a Mac, I believe the decision to avoid Mac was correct on this basis. Mac owners are big losers when it comes to finding attachment hardware from a very competitive market. If Apple had licensed second sourcing for their machine, the Mac today might have been leading in units sold.

The Mac has its place. Pushing data through a network cheaply is NOT what a Mac is for.

> things.

This is (one reason) why a PC bus based board is not in big time running. Designing a modem with at least part of its functionality, if not all of it, on a add-on clone board, would not be that hard to do. Then you would REALLY see the Mac/Amiga/Atari/etc owners fuss/cuss/whine.

Take a PC, install NOS, trim off the fat --> TNC. Maybe the Kantronics DataEngine might do this.

But there is still the issue of how to connect this "TNC" to the host and get the maximum data throughput. Serial ports just don't cut it, parallel ports often are not implemented right, and we may be back to ethernet again.

While we don't need more than 1200 baud for typing back and forth between

people, we do need the higher speeds for many other things, such as FTP, X-windows, and RVR (Radio Virtual Reality). At work we use ethernet between hosts here, and I've already found it to be speed limiting, though adequate. Consider the concept of linking voice repeaters via packet radio. Serial ports are just not going to handle it.

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society

EVERYTHING for the Mac is very expensive. That's why I don't own one. It's nice to borrow one once in a while when I need to run off some viewgraphs (it's a toaster that makes pretty pictures) but for serious hardware and software hacking I'll stick with open, commodity hardware like PC clones. And with Microsoft Windows I expect that even die-hard Mac users will discover that there are alternatives.

Having said that, I still don't know why we're having an argument. I may not like the Mac, but I'm not stopping anybody else from buying one. Nor will I stop anyone who wants to build a network controller with a SCSI interface. Just don't argue that I should be the one to do the work.

BTW, there's another alternative for Mac users: Localtalk. Localtalk adaptor cards are available for the PC, and if someone would like to contribute a localtalk driver for NOS, I would be happy to accept it.

There's not much to it. The machine is a 3-4 year old PC/XT "turbo"
clone with a V-20 chip. (The chips on the motherboard are all socketed
- that tells you something about how old it is.) Plugged into it are
four boards:

1. A 3Com 3C503 Ethernet controller. (Previously this was a TRW
PC-2000 Ethernet card. It worked fine, but the 3Com card draws much
less power.)

2. A 4 year old no-name "multi I/O" card of Taiwanese origin. This
card has a floppy controller, two serial ports, a parallel port, a
game interface and a clock/calendar. The floppy controller is
connected to a single DSDD (360K) 5 1/4" floppy used for booting. The
serial ports have had their 8250 chips replaced with National NS16550A
chips (fortunately this board also sockets its chips, so this was
easy.) The parallel and game ports are unused.

3. A monochrome display adaptor.

4. A modified "eagle" 8530 interface card (similar to a DRSI PCPA card).

The ethernet controller is connected to my house Ethernet. Also on
this net is my 386 NOS development system and an old Sun3/75
workstation on which I do Bellcore work. A Dell laptop is also
occasionally connected to this Ethernet.

One serial port on the XT is presently connected to a 9600 bps V.32 modem that is kept dialed up into a SLIP-mode port on an Annex terminal server/gateway back at Bellcore. The Eagle card had been connected to my WA4DSY modem, but I have temporarily disconnected it so that I could use the XT as a SLIP gateway. (The Sun had been doing the SLIP gateway function but I moved SLIP off the Sun when I "upgraded" it to SunOS 4.1).

Proxy ARP and IP routing entries are installed on the Annex box so that I can reach the entire Internet from a system on my home Ethernet as easily as from work (except for the lower data rate, of course.)

At the moment I can't handle both the SLIP and 56kb functions on the same machine because my "hs" driver for the latter would freeze the machine whenever the 56k modem is busy, and that would cause SLIP characters to be lost. I will get around this in one of two ways: modifying the Eagle board to operate in DMA mode, or using a Grace Communications PackeTen card to handle the 56k modem.

The XT boots and starts up NOS automatically whenever it is powered on. The modem is currently dialed manually, but I will probably add a software dialer routine to NOS soon. Using LZEXE on net.exe has greatly alleviated a space crunch I had on the 360K floppy. Now it has plenty of room for MS-DOS, a packet driver, config files, a copy of MicroEmacs for local maintenance, etc.

I could strip the machine down even further if I wanted (it will boot and run just fine without a keyboard or display adaptor) but having them attached is useful for monitoring what's going on (or for doing a quick telnet session when my other machines are off).

My problems/complaints are as follows:

1. The XT is pretty old technology, and it is rather power hungry for such a small system. Upgrading to a newer set of boards with LSI chips replacing old LS TTL would reduce the load on my UPS. And with the incremental summer electric rate here now at $.13/kw-hr, every little bit helps when you run something 24 hours/day.

BTW, it seems like every chip Intel makes is a power hog. The hottest chips on the motherboard are all made by Intel. The main power hog on the TRW PC-2000 I had been using was the Intel 82586 Ethernet controller, which ran too hot to touch. The board drew 1.73A at 5V, with that one chip drawing half an amp! The National chip used on almost all of the newer Ethernet boards draws only 40 mA. The 3C503 draws only 390 mA.

2. The V-20 is pretty slow. It is actually reasonably fast at switching packets between the Ethernet and SLIP link, but when used as a local terminal it updates the screen more slowly than I'd like.

3. The XT has a noisy fan. I tried turning it off while watching the temperature of the power supply's internal heatsink with an electronic

thermometer. It rose to 50C so I decided not to risk it. Possibly a newer system would draw sufficiently less power that I could safely disable the fan in its power supply.

4. My multi-I/O card's serial ports go deaf occasionally. Based on comments from others with the same board, this is almost certainly the fault of a design problem on the board. Newer serial boards have given me no trouble.

In sum, most of the problems I've run into with this system would be avoided by simply buying newer boards. There's still the need for a standard, well supported DMA-driven HDLC interface card to handle high speed radio modems along with SLIP links. That's being worked on.

Phil

Here, here! Ethernet *is* a bus! And it's a machine-independent one. And you only have to have one slot on your PC/Amiga/Mac/Sun/DEC/SGI/<whatever> no matter how many things you plug into the "bus". [SCSI = 8, including you.] And it's inherently a "multi-master" bus. [Some SCSI interfaces still don't truly support full multi-master disconnect/reconnect SCSI.] And it's fast enough that we can put this question to bed for some time.

And if we ever *do* need more than 10 Mb/s between our hosts and our packet-radio modems, FDDI may be cheap enough by then... ;-} ;-}

Greetings and salutations...

I decided to jump into the world of packet radio...
yesterday... the thought hit me that perhaps i could connect my modem
directly to the radio for a packet station...

so...i looked some stuff up and discovered that...
my modem...at hayes compatable 2400 baud modem...runs bell 103 when
using 300 baud...according to my 1988 ARRL Handbook...and any articles i
could get my hands on...this is the mode used on hf packet...
so...after playing with my rig...and my modem commands...i managed to get
my modem to accept signals from the radio... but i am not getting anything
legible...so...here's some questions...

0. Is this realistically feasable...?

1. Has anyone tried this...or know of anyone who has...?

2. What parity, stop bits, etc...are used...?

3. I am having a lot of trouble with noise...as just about any noise
coming from the audio of my rig will show up as characters on
the screen...

4. Which tone pairs are used?
originate: 1070 space/1270 mark...
answer : 2025 space/2225 mark...
and is the 200 Hz shift correct...
...although bell 103 is duplex...i should be able to receive something on one of the sets of tones....
...all it means is that i will have to change originate/answer mode if/when...i get around to tranmitting anything... because all packet transmissons are made on the same set of tones (not duplex)...

5. anyone have any ideas that could help?

i never touched packet before yesterday...but i've read some...and i've seen it in operation...but being involved in ham radio...and being fluent with computers...i really ought to get involved in packet... but...at the immediate moment ...i don't really want to spend even a little money on a tnc...(which would make life many times easier...)... ...but hey...experimentation is what ham radio is for right??>...

...well maybe...

anyway...

i'd appreciate any help/thoughts/suggestions/ideas/experiences/etc... that i could use...

thanks a lot...

-darrin KA2ZLZ

To avoid flames that I'm thinking only of myself, let me say up front that, although I'm currently running tcp/ip on a Mac, I *do* intend to get a PC-compatible sometime in the next year or so and dedicate it as my communications controller. I'm motivated in this discussion *not* from self-interest, but from my experience working with the Boston Computer Society ham group, where we are working with newcomers who want to use their existing PCs. I repeat, I don't want to condemn them to the obsolete layer 1/2 suite available in today's TNCs.

OK, into the meat:

Phil, KA9Q, writes:

<<I argue that Ethernet is clearly the way to go here, since it is by far the most popular local area networking standard. Unlike SCSI it is designed specifically for networking between separate peer machines... It is already available for almost every modern personal computer. Even laptops can use Xircom controllers plugged into their parallel printer ports. Ethernet boards for the PC are now down to the $100 level...>>

Ethernet would be my choice, too, if it were as universally available as you say. However, Ethernet for the Mac is very expensive, particularly if you're dealing with a compact Mac (the majority of home Mac users) where you need a SCSI<->Ethernet converter. $700-$1000 if memory serves me correctly. The other popular machine we run into is the Amiga. I must profess to know virtually nothing about the Amiga and I'd be interested in any "net wisdom" on whether Ethernet is easily available for it.

N6PLO's posting also favored Ethernet on technical grounds. I have to agree--if you base the decision on technical issues only. But cost?...

Back to Phil:

<<Looks like Gary, KE4ZV, and I think very much alike. With clone PC hardware being so cheap and readily available, it's hard to get

excited about having to hack direct packet radio support into every
type of personal computer.>>

I can easily understand this, especially seeing it from your point
of view. I wouldn't get excited either! As I've said, my cut on the issue is
from doing "missionary" work into the world of non-ham computer users. The
last thing that a passionate, "The Macintosh is my religion and IBM PCs are
worthless junk for any application whatsoever" type wants to hear is that
he/she should buy a clone. (Actually, I toned down the typical wording a
bit... :-)) You have to remember, people aren't always rational about such
things.

Dana, KK6JQ, writes:

<<Time permitting, I've been slowly putting a 9600-56000 baud PAD together
which talks to a parallel i/f, initially a PS/2 parallel port (they're designed
to be bi-directional), later on a SCSI port. The design goal is a low cost PAD
which people could attach to their Macs, Amigas, Suns, RS/6000s or PCs
(assuming they've already got a SCSI controller). >>

That's exactly the kind of thing I'm thinking about. KK6JQ again:

<<The issue of putting more smarts in a TNC could keep the current
generation of 'machine-independent TNCs viable while more permanent
solutions are developed. It also has the advantage that a single station
would have trouble hogging a channel. Making a TNC smart enough to pre-process
packets even when running in KISS mode has some real appeal.>>

It's necessary if (a) the host interface runs slower than the network, and
(b) the channel is TDMA/shared. If we evolve toward point-to-point service,
the only real advantage of smarts in the "TNC" is to offload processing tasks
from the PC. On a point-to-point channel, throughput will be determined
by the slowest link in the system, regardless of channel signalling rate.

Along this line, perhaps we just need a "NOS-in-a-Box" Data Engine
(or equivalent) that brings a fully-implemented protocol suite in hardware.
Because of Bdale's and others' work, this is nearly a reality today. N6GN has
also discussed the desirability of a hardware packaging that includes at least
level 3. So maybe that's the turnkey solution we offer newcomers. Keep the
"TNC" mentality alive for those who want it. Those of us who want greater
flexibility/performance go the route of dedicated clones and keep the "smarts"
in the PC.

Just how hard is it to build an Ethernet interface into a dedicated box, anyway? Is it simplicity itself, or does it take wailing and gnashing of teeth?

For that matter, we could get there by adding an Ethernet interface to something like the Kantronics Data Engine...

Also, are we talking about stringing RG-62, or whatever the coax used is, or are we talking about stringing transceiver cables (which are a bit thicker)? Does it make a big difference?

I suppose I'm going to have to learn about Ethernet fairly soon, since the Tower has an Ethernet board in it (but the only connection on the back is a transceiver port - is there a thinwire transceiver I can get?); the only LAN I'm familiar with is ARCNET.

Thin Ethernet is RG58, same as non-foam in-the-shack ham coax.

RG58 runs under the rug quite nicely, and as long as you aren't wearing
sharp pointy heels, you won't hurt it by walking on it.

Crimp-on 'commercial' BNC connectors are cheap and real easy to put on.

You can get really nice thinnet transceivers from Cabletron and lots of
other people, and I've seen them around $150 or so.

I'm assuming you mean a dedicated box with some other ports and a micro to
serve as protocol engine or whatever. If you only want a cable
transceiver (aka Medium Attachment Unit or MAU), just buy it.

In my opinion, the difficulty is somewhere in between. With the currently
available chip sets, the logic design is pretty easy. There really aren't
very many degrees of freedom between the uP bus interface and the coax;
the chip manufacturers publish application notes that recommend specific
isolation transformers, etc. Some of the new chips integrate most of the
bus interface as well. For example, one of the SEEQ parts has a pin to
tell it whether it's talking to an Intel or Motorola bus, and it
configures itself accordingly.

Most of the application notes also give sample designs for the popular
buses. National, for example, has a range of application notes for the
popular 839x chip set ranging from a simple 8-bit polled port to PS/2 and
NuBus DMA. Most of these appear to be adequate but leave some room for a

designer to "add value."

What's still a bit tricky is the layout and packaging, although there are usually guidelines for this as well. A multilayer board with power and ground planes is pretty much mandatory. Unfortunately for AR, such boards are fairly expensive, especially in small quantities. Some CAD packages also are not very good at routing critical nets in the way you'd like.

Another issue is EMI. I think Phil Karn posted some of his war stories here a while back. One recommended technique uses surface-mount decoupling capacitors (for low lead inductance) rated at 1000 WVDC (to meet isolation requirements). You don't find these at Radio Shack. Or very many other places either. Putting everything into a dedicated box under your own control helps some.

> Also, are we talking about stringing RG-62, or whatever the coax used

For thin-wire Ethernet (aka 10BASE2 or Cheapernet), RG58A with BNC connectors is standard, although I've seen other types of thin 50 ohm coax used as well (variations in flame resistance and the like, I think). For AR applications, I favor this over 10BASE5 with the thick coax and the separate transceivers. On the other hand, the n6gn/n6rce 10 GHz bit pumps use the same 15-pin interface as an Ethernet MAU.

1 INTRODUCTION

Traditional microprocessors have to be programmed from scratch. Every processor requires some kind of an operating system to let you execute a program. Multi tasking will require again a different operating system and non of this stuff is standard. Oh I am sorry you want to call Unix a standard. Go ahead! Now there is this new chip the transputer, it handles processes instead of assembler instructions. It has a built-in "on chip" round robin scheduler. Typical time slices are 1 milliseconds and a context switch (process switch) takes 1 micro second. Oh I forgot HAMS always want to know the price. A PC plug-in board is $236 without memory. Interested? Read on!

2 THE TRANSPUTER AND OCCAM

One way out of the traditional computing requirements has has long been sought in the use of parallel computing. In the past, many attempts to realize parallel systems with traditional processors have failed due to the software overhead. This is why the interfaces all require special hardware or busses, e.g. ethernet, SCSI you name it.

Here is a new concept of communication between processors and processes. Communication between processors and processes is done by means of channels. Due to the synchronization properties of these channels, the restriction to one processor no longer exists. The transputer hardware and companion Occam software development has implemented this concept. By using a formal specification language, the correct behavior of the implementation of the Occam constructs in hardware was formally proven. The hardware-software integration resulted in the transputer-Occam combination. The transputer may be considered as a building block for parallel computers. Occam enables programming across these parallel transputers. In the following paragraphs the operation of the transputer will be explained, based on the following list of major characteristics. From this list a number of significant elements of the transputer chip can be identified.

The following elements have been integrated as one micro computer chip.

1. Communication to other transputers is performed over four self-synchronizing, high speed (20 Mbit/sec), DMA driven, bi-directional, serial links.
2. A round-robin process (task) scheduler is implemented in micro-code realizing a process switching time of 1 microsecond.
3. A floating point processor realizing 1.5 Megaflops.
4. A built-in timer with an accuracy of 1 microseconds in high priority mode or 64 microseconds in the low priority mode.
5. Fast (50 nano-seconds) internal memory of 4 Kbyte.
6. A 32 bit 10 MIPS CPU.

2.1 The Occam process

The underlying idea of Occam is the notion of a process. A process is a part of a program that starts, performs an action and then terminates. The idea is that processes may be executed in parallel. The communication between processes is done via self-synchronizing channels. A channel is a one way point-to-point connection from one process to another. The processes may be located on different transputers. In that case the communication over channels changes into communication over links. There is no need for the programmer to worry about the implementation of the channel or link protocol because it is implemented in micro-code on the transputer chip.

Examples of so-called primitive processes in Occam are:

```
x := 3          assigns the value of three to the variable x

channel1 ? p    takes a value from an input channel1 and puts it in p

channel2 ! q    takes the value of q and outputs it over the channel2
```

An Occam program consists of combinations of primitive processes so that a number of these primitive processes may be combined into a larger construction. For this purpose Occam supports the following constructs:

```
SEQ             To indicate the start of a series of sequential
  process1      processes.
  process2

PAR             To indicate the start of a series of parallel
  process1      processes.
  process2
```

Note that the indentation under the SEQ and PAR constructs are syntactic and are used to indicate the begin and end of the construct.

2.2 Links and Channels

In Occam communication via links looks as follows:

```
In transputer A                         In transputer B
we have the code:                       we have the code:
                          communication
Link.2 ? var.y      <-----------------  Link.2 ! var.b
                            via Link.2
```

The input ? and the output ! processes may be considered as the synchronization between processes running on transputers A and B. If the process on transputer-A arrives at the input instruction on Link.2 and transputer-B is not yet ready to provide its output on Link.2, the process running on transputer-A will be de-scheduled until transputer-B signals

that it is ready to send the data over Link.2. At that point the inputting process on transputer-A is resumed and the data is transferred via Link.2. This results in a synchronizing action between the processes running on different transputers. In this way the transputer links provide the necessary system interconnection and synchronization. The only thing the programmer has to do is to define the appropriate input and output actions.

Identical to the link concept, the channel concept is used to communicate between processes located on the same transputer as illustrated below.

```
        In process A                            In process B
        we have the code:                       we have the code:
                              communication
        Chan.1 ? var.x      ----------------->  Chan.1 ? var.a
                                 via Chan.1
```

This unifying link/channel concept is very convenient during the system design and check-out phase. Different hardware and software layers can be developed independently as long as the software and hardware interface format has been defined.

Inside the transputer the channel/link administration is kept in one memory word. This memory word will contain the most negative value to indicate that the channel has not yet been called, or a value that is interpreted as a workspace pointer of a (de-scheduled) process. The transputer channels may therefore be considered as a standard system interface because they provide the necessary system interconnection and synchronization.

2.3 Interrupts

The transputer has an interrupt signal pin connected to the event channel. This event channel is read identically to a link, although no data can be transferred. It can only be used to activate a process that is waiting on an input ? from the event channel. As soon as the event channel is activated, the waiting process is scheduled by inserting it at the back of the ready queue in the low priority mode, or it may be scheduled at once as a high priority process. The use of the transputer interrupt signal is illustrated in the following Occam interrupt process that is activated every time the event pin is triggered. The program starts with the definition of the process name with the external channel definition. The internal event channel is declared as the type ANY because there is no data transport over the event channel. This event channel is associated with the actual hardware pin. This is illustrated in the following program.

```
PROC interrupt (CHAN OF INT16 output)
  CHAN  OF  ANY event:
  PLACE event AT event..in:
  WHILE TRUE                  <<< Do forever loop!
    SEQ                       <<< Start sequential process
      event ? any             <<< Wait for interrupt
      ....execute handler code
```

```
:                                <<< Occam terminator of a process
```

The transputer has one high-priority and one low-priority operating mode. The interrupt process should preferably be executed in the high priority mode in order to reduce the interrupt response time.

2.4 The Timer

The timer channel should also be considered an input channel. Times of the internal running clock are obtained by reading the timer channel and operating on the time value. The Occam code to use the timer is illustrated with the following SEQuential process that causes a delay:

```
PROC delay (VAL INT interval)
  TIMER clock:
  INT time:
    SEQ
      clock ? time
      clock ? AFTER time PLUS interval
:
```

Internally the timer queue differs from the ready queue in that it is kept sorted in the sequence of the wake up times of the different timed processes.

2.5 The Scheduler

In addition to the channel protocol concept, there is another important difference between transputers and other microprocessors. That is the built-in scheduler. The transputer should be considered as handling tasks or processes rather than machine instructions. These processes are controlled by a built-in scheduler. The process administration is the main activity of the scheduler. The scheduler keeps track of the different processes by keeping a list of processes in an area of memory that is called the workspace. The workspace of the current process is pointed to by the transputer register called workspace pointer. The workspaces are linked together to form a queue. The scheduler keeps track of four queues, i.e. for each priority a ready queue and a timer queue. The beginning and end pointer to a queue are maintained in the transputer registers called Front pointer and Back pointer. Workspaces are added to the ready queue by reference to the back pointer and workspaces are extracted by reference to the front pointer.

2.5.1 High-priority mode

The process (or task) scheduler can operate in one of two modes, i.e. the high-priority or the low-priority mode. In the high-priority mode the

executing process cannot be interrupted by another process (non-preemptive scheduling). De-scheduling can only occur when:

- a process is completed
- communication with a channel/link is not (yet) possible
- the process waits for a timer to elapse

2.5.2 Low-priority mode

In the low-priority mode the processes are, by means of time-slicing, scheduled in a round-robin manner. Here processes will be de-scheduled by:

- completion of the process
- awaiting link or channel communication
- expiration of a time slice
- a high-priority process becoming ready

The de-scheduled process will be added to the back of the ready queue and the process from the front of the ready queue will be executed. The time slice in a transputer is typically 1 msec. and the process switching time is of the order of 1 microsecond. In Occam the priority may be assigned using a PRIority addition to the PAR construct.

Without priority:

```
PAR
  process.1
  process.2
```

With priority:

```
PRI PAR
  process.1
  process.2
```

The processes 1 and 2 are executed in parallel, either both at the same priority, or with the PRI PAR: process 1 will be executed in high priority and process 2 in low priority. The PAR process is only finished after both processes have been executed.

3 THE BASIC BUILDING BLOCK METHOD

A systematic way to introduce parallelism is to start with very small processes and build a system with these elementary processes. This approach is similar to methods used in past in analog computers. The internal scheduler on the transputer will realize parallelism while running these processes. As an example I like to mention the realization of a control program with the use of only five basic elements. The basic elements in this system were:

a splitter block:	tee
a gain block:	gain
a summer block:	sum
a minus block:	min
an integrator block:	int

Let's first define these basic elements and then look at the controller program using these basic elements.

```
PROC tee (CHAN OF REAL32 in, out0, out1)
  REAL32 x :
  WHILE TRUE
    SEQ                                          /|
    in ? x                                in ---/  |----out0
    PAR                                          \  |----out1
      out0 ! x                                    \|
      out1 ! x
:

PROC gain (CHAN OF REAL32 in, out, init)
  REAL32 x,k :
  SEQ
    init ? k                                    |-------|
    WHILE TRUE                            in  ---| gain  |--- out
    PRI ALT                                     |       |
      init ? k                                  |---|---|
        SKIP                                        |
      in ? x                                        |init
        out ! k * x
:

PROC sum (CHAN OF REAL32 in1, in2, out )
  REAL32 x1, x2 :
  WHILE TRUE                                  |--------|
  SEQ                                 in1 ----|        |
    PAR                                       |  sum   |---- out
      in1 ? x1                        in2 ----|        |
      in2 ? x2                                |--------|
    out ! x1 + x2
:

PROC min (CHAN OF REAL32 in1, in2, in3, out)
  REAL32 x1, x2, x3 :
  WHILE TRUE                                  |--------|

    SEQ                               in1 ----|        |
      PAR                                     |        |
        in1 ? x1                      in2 ----|  minus |---- out
        in2 ? x2                              |        |
        in3 ? x3                      in3 ----|        |
      out ! -((x1 + x2) + x3 )                |--------|
:

PROC int (CHAN OF REAL32 in, out, init)
  REAL32 x,t :   <<< SYSTEM STATE AND TIME
    SEQ
      init ? x;t <<< INITIALIZE STATE AND TIME
```

```
            WHILE TRUE                                |-------|
              PRI ALT                                 |       |
                init ? x;t                  in -----| inte- |---- out
                  SKIP                              | grator|
                TRUE & SKIP                         |---|---|
                  REAL32 dx :                           |
                  SEQ                                   | init
                    PAR
                      in ? dx       -- Input in parallel
                      out ! x        -- with output
                    x:= x + (dx*t)
      :
```

These building blocks defined above may now be used to convert for example a control system defined as a block diagram (think of it as an analog computer) into an Occam program to run on a transputer. The application realized in our control laboratory is given below. It is not necessary for you to study this program it is only given as an illustration. Note that the insertion of the SPLITTER blocks is necessary because the Occam channels are point-to-point connections. Installation of a SPLITTER block looks like a solder joint.

After the definition of the basic building blocks, the complete calculation process for one control mode looks like the following Occam process: The channel names have been changed to a vector type representation.

```
PROC calc ([4]CHAN OF REAL32 in, CHAN OF REAL32 outM,
     [13]CHAN OF REAL32 I)
  [27]CHAN OF REAL32 D :
  PAR
      gain ( in[0], D[0],  I[0]  )
      gain ( in[1], D[1],  I[1]  )
      gain ( in[2], D[2],  I[2]  )
      gain ( in[3], D[3],  I[3]  )
      min ( D[0],  D[1],  D[2],  D[8] )
      min ( D[3],  D[4],  D[5],  D[9] )
      sum ( D[6],  D[7],  outM  )
      gain ( D[8],  D[12], I[6]  )
      gain ( D[10], D[6],  I[4]  )
      gain ( D[11], D[7],  I[5]  )
      tee ( D[9],  D[13], D[14] )
      sum ( D[12], D[13], D[15] )
      sum ( D[16], D[14], D[17] )
      gain ( D[18], D[5],  I[10] )
      gain ( D[19], D[4],  I[11] )
      tee ( D[15], D[20], D[21] )
      int ( D[17], D[23], I[9]  )
      sum ( D[22], D[24], D[26] )
      gain ( D[20], D[22], I[7]  )
      gain ( D[21], D[16], I[8]  )
      tee ( D[23], D[24], D[25] )
      tee ( D[25], D[10], D[18] )
      int ( D[26], D[27], I[11] )
```

```
          tee ( D[27], D[19], D[11] )
     :
```

With these instructions the scheduler of the transputer can go to work and schedule all these parallel processes for execution. The advantage of this method is the speed of the development of the program. The above program is for a digital controller.

There are, however, some remarks to be made about this design method. Because a large number of building blocks are interconnected, there is a danger of deadlock. It is a property of so-called I/O-parallel blocks that if combined into networks, they will exhibit deadlock free properties. An I/O parallel block executes the input and output in parallel and not sequentially. The careful use of a few I/O-parallel blocks in a network will result in a deadlock free behavior of the network. For that reason the integrators used above are I/O parallel as indicated in the corresponding Occam program, resulting in a deadlock free program.

4 CONCLUSIONS AND SUGGESTIONS

The overall conclusion of the experience gained over a number of projects is that the application of transputers allows the design of high-performance systems. For complex systems the basic element method is a very good approach to realize the parallel programs.

I would like to invite all you TCP IP NET etc. software to suggest which application according to your opinion would be interesting for packet radio. Just to make you feel better: it is possible to program a transputer in C, Pascal or even FORTRAN. It is also possible to cast C program in an Occam harness so that Occam will take care of the parlellism. But Occam is a nice parallel language and it illustrates the parallel implementations very well.

If you have any questions please direct them to my email address. I will try reply in the form of another write-up

I and my friends have done working designs using the National chipset. If
pressed, I could probably scrape up a schematic fragment. It's not many
chips.

I also agree that ether cards for the DE, PS-186, and Grace PackeTen would
be nice. I'd also like to see SCSI...

Can't I have my cake and eat it too? :-)

Even for those of us who are lucky or rich enough to own
workstation-class computers for home use, the PC may well be a better
choice for packet work. I'm planning a shack network and packet server
around an NCR Tower XP I've recently acquired. Even though it has both a
SCSI interface and a multiprotocol communications adapter, it'll be
connected to the packet network across an Ethernet connection to a
dedicated PC packet/IP switch. The reason is simple: that way, I don't
have to write device drivers.

I'll probably do this with the MPCA, but it's more for educational value
than production (there's that nasty word again!) use. My Unix system has
better things to do than stuff bytes into packets.

The netrom node owners in this area are considering a switch to the
Rose software. There are several of use who are running the ka9q tcp/ip
code over netrom, and we would like to know what impact this will (or
hopefully, will not :-) have on tcp/ip operation.

Does anyone have any experience with operating tcp/ip through Rose nodes?
I know next to nothing about Rose, so any information would be appreciated.

    I am studying for my HAM liscense, and I am only interested in PACKET
operation. I love Phil Karn's (KA9Q) package, I am using it to do SLIP
between my PC, and my UNIX Box at my home. I have been in CB radio for
about 5 month's now, and I would like to stop playing around and get serious.

    I have been into data communications since 1984, BBS'ing it over the
phone lines. I made up my mind to get my HAM liscense when I got Phil Karn's
package via anonymous FTP looking for something to do SLIP with on a PC, and
I found out that you could do data communications over the radio, and better
yet, TCP/IP! I immediately called a local board, and downloaded a learn
morse code program. I almost have it down enough to get my novice, but I want
my General.

To make this short, I am not here to do 1200bps over the radio, I want 9600bps, I'll even settle for 4800. I know that there is stuff out there to do it with, but I'm not sure which is the best configuration. (And I don't want to make an expensive mistake!)

I would appreciate any feedback on what modems will go that speed, which is the most reliable, which has the most options, etc... And most of all, which radio will work with it.

Packet is the reason I am getting into HAM, no doubt about it. Otherwise I'd stick with CB and put up with the garbage (noise, skip, bad attitudes, etc...)

Thanks in advance...

And in case anyone had missed the point you can hack the Icom, the
microphone _and_ the triband beam if you've a mind so to do. These days
I don't often have the time to hack hardware or software but that of
itself wouldn't, and shouldn't, stop anyone coming on the air and using
other people's efforts.

You might add that to get Phil's software actually working requires
rather a lot of hacking in itself, but that's another story!

The best advice I can give is for you to get in contact with others in your area and find out what they are planning to use. Our GRAPES 56 kilobaud RF modem is currently the fastest production system, but it is of no use if you don't have partners who are also using it. One step down is the G3RUH 9600 baud modem. It requires a TNC2 for digital drive and a direct varactor modulated radio. Below that is the HAPN 4800 baud system and the Kantronic 2400 baud system followed by the ever popular Bell 202 1200 baud modem built in by default to all TNCs.

Remember that you must cut your thruput in half for each relay hop you use and that you must count the serial links between your computer and TNC and your partner's computer and TNC as hops. Thus, if you are using 1200 baud modems, 1200 baud serial links, and one relaying digi-peater, your maximum net thruput is considerably less than 300 baud. The reasons that it's less include transmitter keyup delay (Txd), receiver unsquelch delay, PLL lockup delay, and the fact that you must send a packet then wait for an acknowledgement before sending another. Add to this contention for the channel with other users and you should expect thruput on the order of 150 baud. With faster modems, digital interface cards direct on the bus of your computer, and longer packets, you can expect correspondingly higher thruput. Example: with direct connects between 56 kilobaud modems, response is similar to a hard wire 19.2 kilobaud link.

A rough guide to system pricing:

56 kilobaud:

RF modem (28Mhz output)	$250
Transverter to 220 Mhz	$229
Digital interface board	$130
Total	$609
Cost per baud	$0.0109

9600 baud:

G3RUH modem	$100
TNC2	$130
220 Mhz FM radio	$450*
Total	$680
Cost per baud	$0.0708

1200 baud:

TNC2	$130
144 Mhz radio	$450*
Total	$580
Cost per baud	$0.4833

*You may find used FM radios for considerably less than the above quoted new pricing. But if you have to buy everything, the most cost effective route is the 56k system.

Robin-
Could you elaborate on that? When I first used the KA9Q package, all
I had to do was add my personal information (callsign, IP address, etc.)
to the NET and BM startup files, toss a few lines into the ftpusers
file, and and make sure I had the latest hosts.net list for this area. I've
always assumed that setup on an IBM system is just as simple. Isn't it?

Patty

How about the K9NG (I think) 9600bps modem offered in partial kit form
from TAPR for ~$25? I'm interested in knowing the differences/
advantages/disadvantages between the G3RUH & TAPR's offering.
Why would someone want to use one over the other?

Though I'm no expert in this area, I wonder if this thing called
"homebus" (a network for the house so the various devices in the house
can be controlled by a computer or similar) might be usable (whenever
homebus comes out) for the above application. Hook up the TNC (and

server) to the homebus up in the attic, and sit at the homebus computer
somewhere else in the house and do packet radio. Probably turns out
that the bandwidth is not enouugh to do more than 1200baud.

A notice found on a piece of test equipment made in Japan:

The K9NG modem is a semi-kit for $25; you have to add another $10 of
parts to it. It is a simple FSK with scrambler system; does direct-FM
on your radio. It switches from receive to transmit; you have to have
two of them in the unlikely case that you're doing full-duplex. About
half the parts on it are for PTT switching of the old FM-5 transceiver
and may be omitted in a lot of other applications. For some radios you
have to apply compensation to make up for unexpected nonlinearities.

The G3RUH is a similar design except that it is full duplex and has a
compensation circuit on it that is designed to compensate for both the
transmitter AND receiver, which implies that a homogeneous network is
required. In practice, that isn't quite true; it will work with several
different kinds of radios in the system. Many people use the G3RUH for
medium-speed satellite work.

The California medium-speed backbone on 6 meters is all K9NG modems on
old commercial radios. Because of the modulation acceptance of some of
the radios, we backed down to 4800 bps - although that's not that much
of a loss anyway, since a standard TNC-2 running net/rom doesn't do
much more than that in overall throughput anyway. We don't use the
backbone for user access; it's an intercommunity link.

I am posting this message for Len. You can e-mail to him at
73147,3073@compuserve.com. Since I am not a ham radio operator, and know
very little about this project, please contact him with any questions. Also,
please mention where the information you received about this project came from.

RUSSIAN PHRASES FOR AMATEUR RADIO: UPDATE

This is a new 20-page syllabus compiled by W6HJK to help amateurs
better communicate with their Soviet colleagues. A 90-minute audio
cassette has been added to help with pronunciation. You need not be
an expert in Russian, only interested in "trying."

The booklet provides (1) English words and phrases for QSOs,
accompanied by (2) the Russian translation and (3) the English
transliteration, to assist you in pronouncing the Russian.

The syllabus follows the natural sequence of a QSO. There are
additional sections on the Russian alphabet, phonetics, CW characters,
numerals, and given names. Suggestions are made for addressing mail
to the Soviet Union.

The author undertook this project out of a personal interest in
improving the quality of his QSOs with Soviet hams and to enhance USA-
USSR relations. A nominal cost of $5 ($7 international) for the
booklet, and $6 ($8 international) for the audio cassette, are payable
to the Beyond War Foundation, the original sponsor and an educational
endeavor to build global dialogue and cooperation.

Requests should be sent to: RUSSIAN PHRASES FOR AMATEUR RADIO

What radios does the K9NG 9600 seem to work OK with?
Is the list for the G3RUH 9600 different?
What characteristics of the radio are necessary?

One additional note on the G3RUH design, it uses PSK rather than FSK
and uses less bandwidth while having a better signal to noise ratio.
I have interfaced a pair of these to GE MASTR UHF handhelds with good
results. I tried hooking them up to Icom and Kenwood HTs with poor
results. Apparantly the PLL loop filters in these rigs aren't happy
with the waveform produced by the modem. Best advice, use a crystal
controlled rig.

Patty,

the point that I was trying to make is that there is scope for hacking,
in the sense of understanding (or not) and changing things, in most
things that are part of Amateur Radio. What you describe is _competent_
hacking, as opposed to the other sort.

If you hadn't known what to do, it would have been a riddle.

Robin

P.S. It's an ST, but it's not operational yet, and that's another story!

In article <31177@cup.portal.com> John_A_Pham@cup.portal.com writes:

   I'm planning to build a SCSI card for my computer, and since everyone is
   talking SCSI, perhaps someone would enlight me on selecting the right
   SCSI chip to use. I have Fujitsu MB87030, National Semi 5380 and
   8490 spec sheets but I wonder which to use. I know that the 8490 and MB87030
   can handle to up 4Mbytes/sec transfer, but which chip is easier to program
   and which is easier to interface to differential SCSI bus.

I am involved with using the Am33C93 SCSI bus interface chip. It is a
newer design and seems to be very complete and easy to use.
Internally it is an 8 bit micro. It supports DMA and has regular bus
driver built in. Works both target and host mode and will run up to 5

Mb/s.

If you are starting a fresh design check this one out before deciding.
The spec sheet I have is AMD, I don't know who else makes it.

Has anyone else tried to compile NOS for the PC with Turbo C++?
Doesn't work. Did with TC 2.0, but after looking at what C++
complains about I wonder how it did.

The point I tried to make is that the bitty boxboys can hack their own
tcp/ip, just like Phil ka9q hacked his for HIS machine, and Rob pe1chl hacked
it for HIS machine, etc.

BOTTOM LINE: We don't care what computer you use on NET! If you want to run
an opamp-analog computer - FINE!!! YOU write the code for it! If you're
a starving student, or??, it's not Phil's problem, is it? Perhaps you could
do your masters thesis on hacking a split-screen, color NOS for a T/S 1000?
>
> You might add that to get Phil's software actually working requires

Yup - If you try to run defaults here in L.A., you might as well turn
your rig off - it'll work about as well....

Hi,

This fall I will be setting up a packet-radio-BBS at Plymouth State College on a PC and am wondering what type of software is available for PC's and the different networks that I can tie into etc... I am a newcomer to all this so all the help and advice you can give me right now would be more than appreciated. I am primarily interested in the pros and cons of different types of software packages, and where I can obtain them.

Thanks,

-Laurianne-

Hello there,

I managed to get a hold of the KA9Q package for the Atari ST. It took quite a
bit of looking and asking, until a kind sould in Europe uucp'd me the files.

If someone would like a copy of the files, I'd be happy to uucp them to you.

I got several back issues of the "Oscar Satellite Report", which is
the substitute for the AMSAT newsletter, and there's a report of
hooking up G3RUH 9600bps modems to many current rigs successfully, so
maybe crystal control is not necessary. Since apparently the two
packet uSats use FM up on 2M and down on 70cm, at 9600bps, it appears
that a dual-band FM rig, G3RUH modem, TNC, computer, and dual-band
antenna omni-directional antenna (like two Jpoles) should be enough
for satellite packet communication. Sounds like the low end for
satellite work is getting lower.

Hi, Robin.

I guess this is just a semantic difference. When I hear "hacking,"
I think of "writing code." To me, having to type a few things into
some setup files is the same thing as typing a few things into the
RAM of a TNC. It's just like setting up a modem program, where you
need to indicate the phone number you want dialed, what baud rate
you'll be using, perhaps your login ID, etc.

I just didn't want newcomers to get the impression that there was
any programming required to get Phil's software up and running. The
applications are fully executable, and only require some entries in
a few configuration text files.

John

Your reply path didn't work for me so I'll try replying here.

I thought I would let you know
that there is indeed some work going on toward higher speed networking.
Here in northern California a number of us are working hard to get a
prototype 250Kbaud network in place. This is using clusters of "hub
served" local users (a small number) all tied together with point-point
backbones made from either similar 250-500 kbaud "user" radios (we are
bankrolling this ourselves and have finite resources (:>)) or microwave
hardware. A description of some of our initial mega-bps microwave hardware
was in the December 1989 issue of Ham Radio magazine. The next version of
backbone hardware will actually be done differently but this should give
you some idea of what it may look like.
A prototype 250Kbaud radio is described in a recent Gateway/QEX
note (sorry, I forget the month but it was this spring). The first
12-15 radios are on 904 and 916 MHz and run about 10 watts output
into a 2 MHz digital channel. I hope to have another "batch" of these
completed for the 1200 MHz band before too long.

Along with the radio hardware, we are working on some shared memory
i/o hardware to switch/route several streams of higher rate data. Along
with the hardware we are also developing link layer protocols for these
cells with the end goal to provide layer3-to-the-user services everywhere
in the network.

If you haven't already, you may want to look at the last couple of
years of ARRL computer networking conference(CNC) proceedings. Last year
several of us, Mike Chepponis, Phil Karn, Bdale Garbee, Kevin Rowett and
myself, did an article on the implications of high speed networking for
amateur radio.

Hope this is of interest.

Feeding USENET by ham radio is technically possible (though difficult), but
is TOTALLY ILLEGAL, due to the commercial nature of many USENET messages
and the fact that regulations require a ham to screen ALL messages BEFORE
they are transmitted to ensure no illegal traffic is sent, which would be
a bit hard to do, unless you're a REAL speed reader.
Bear in mind that international agreements that allow ham radio are created
by governments, many of whom run government monopolies on telecommunications,
and as such, prohibit ANY use of ham radio that "bypasses" phone or radio
common carrier service, or is in any way involving the normal business of
any person or business.

Hello everyone in Netland. I have small problem with my Eagle PC clone.
When I run nos (g1emm v900612) [or nos from DRSI or net] My pc locks
up and dies. I put the same software on my AT clone and It works fine.
It seems that there's a memory problem, sometimes I get a garbage
collection message? It seems to be ok until it receives (via trace also)
packets. I thougth it was the DRSI driver (it locks up real fast), but it
also seems to have aproblem runing slip.

The computer: intel 8086-8 processor, 512 on board, to 640 on sixpack.
2 serial ports, adaptec RLL controller, 1.2M and 360K floppy,
Wilkinson bios, monchrome adapter and screen, real time clock chip.
running DOS ver3.3 Currently disabled: ems card .5meg with drver uninstalled.

Any ideas would be appreaciated. I really don't want to run NOS
for packety radio on my AT
since it's my primary workstation (uucp,sco,vga,etc).
Thanks.

I have a proposal for an idea. I'm sure that there are LOT's of execptions
for the way this might work, but I thought I'd give it shot.

IMHO: I get lost easily and without the domain.txt file so does tcpip.
Even with a prepared map it seems that I still get lost and don't

know where to go with my packets. In this area we're pretty far behind
many other areas, but we're trying to catch up. When I look at the
domain maps for the hard wire servicess they do seem to make a little
more sense, at least as far as subnets go for an area of tcpip address.

The idea:
Assign ip address based on state, area, city idea. Germany uses
a zip code number system that you can figure out where you letter
is goinf just by the zipcode (and you don't have to look it up in
a computer). [44] is pretty much where we start. Let's make the
next entry state/area or area/state. Then let the next are be the
city, then finally the user. This would give us an address:
[44.69.0.3] or n2hkd.ROC.WNY.AMPRORG. I know that some of these
things have been discussed before, but I thougth maybe it deserves
to be discussed again.
If the area/city were to use the Standard Airport codes then it
would be easy to mail stuff (by air or wire, etc). We then might
not need to worry too much about area/state.
Therefore the above address would look like n2hkd.ROC.ampr.org and
would allow for the address subnet to be 44.69.x.x.

Part two: How to find people and maps.
Lets then assign a domain info machine address. Ie. RFCARC BBS running
MSYS. let it be the keeper of the complete domain info.
Let one machine keep the maps for an area in /public/area.map.
And let this one machine have a specific subnet adress. IE x.x.0.1,
and have it keep the subnet map x.x.Z.x.
This way I could go to any area and look/connect to x.x.0.1 and
I would be able to find out where all x.x.Z.x area maps were.
I could then log onto x.x.Z.1 and get the area map for that subnet
and know who I can contact via the domain.txt file.

Lets take an example. I go visit Mom and Dad on LI NY for a week
and I take my portable. I can listen for some traffice and then find my
way to 44.68.0.1 or 44.68.Z.1. I then can find my college buddy
and get his IP addrss and sen him mail (even though I don't have his
ip address before hand) so that we can get together. Mail forwarding
would work easily too. the packets fro routing can be
screened by the router for [44.69], very easily to go to the next
router. This would work for land service interconnects too!

If I could net rom my way through the (ie) Neda backbone, I could then
also figure out my paths via this hunt and peck routine :-).

The good news would be that the area domain directors would only have
to mantain one area for addresses and could then download and build
real maps for our selfs. As it stands right now I find it difficult
at best to find others who have an interest and maybe even an IP
address in this area , but we are new to this...

The next problem for us is how do get off this island? anybody
got a bridge to other tcp/ip users from upstate NY?
If anyone who reads this is interested in connectivity to you

lan so we can wan :-) we'd love to hear from you. thanks

Thanks for listening.... any comments?

At present there is no 220 usr packet in this area. What I'd like to
do is use my contest 220 gear and cross link it to the 145.05 freq
we're using for tcpip. Is there a way to do it easily by
using two TNCs and two radios? Will NOS send packets out on
both attach'ed devices so that the same packets are availble
on both bands (let the 220 connect to the BBS on 145.05).
I thougth about add route default ax0 ax1?

Would it be easier just to connect the radios to the same TNC via
the audio (more apt for collisons though).

Has anyone done this (without running a BBS software would be
prefered).????

Allowing for the new priveleges is easy, but making it work
means a lot more.

I had some difficulty understanding the proposal (perhaps the writer's native language is other than English?), but I think he's suggesting geographic subdomains of the amprnet namespace as a means to facilitate routing. Again.

Instead of replaying the same arguments over and over and over again, I'll just say that such a scheme has many disadvantages and very few advantages, and reflects a complete confusion on the part of the proposer among the differences in routes, addresses, and hostnames.

For a review of this recurring proposal and discussion, please browse through the packet-radio and tcp-digest archives located on host ucsd.edu, available by anonymous ftp. If you don't have ftp capability, perhaps someone can fetch them for you.

Let's not exaggerate. It is not TOTALLY ILLEGAL. It is illegal only for those individual messages with commercial content. It shouldn't be too difficult to write a software filter to toss the questionable ones into a holding area for review by a carbon based unit.

This is being posted to the net because I have trouble sending mail to
max@.UUCP Please fix. Besides, this may be of interest to others
judging by some of the questions I often see.

You need to get in touch with the local packet community for the
following reasons:

1. They will have BBS software

2. They will help you install it

3. You will need to get feeds from and to other BBS in your area.

You can find packet on:

145.01, 145.03, 145.05, 145.07, 145.09 Mhz. There may also be other
local freqs in use. Ask the locals, they have the answers for your
neck of the woods.

The ham for-sale stuff BY HAMS would be OK. All the REST of the commercial
stuff would NOT be.

Scrambling it would not make it OK. That would just make it worse.

As Jim Grubs points out, filtering is needed. But I am not so sure that
an algorithmic filter would be very good. I for one don't plan to gate
USENET onto ham radio.

There is a specific exemtion for INDIVIDUAL hams to list personal gear for
sale, discretely, but they cannot be in the BUSINESS of selling ham gear,
or make it a routine activity.
The FCC "blandly ignores" things like recommending ham gear sources, as long
as the recommender doesn't WORK for the source in question.
Encrypted data of any sort (with an exemption for spread-spectrum modulation
with specified parameters) is prohibited on ham radio (including ROT 13).
Basically, before thinking about doing anything like this link, buy and READ
CAREFULLY the FCC rules for ham radio, "Part 97", and remember that the FCC
will ALWAYS interpret the rules in the most restrictive way where business
or non-ham access to ham transmitters is concerned. Hams can't even work
with the local PD on things like "Halloween Watch Patrols" according to the
FCC because it's contributing to the "routine business" of the Police Dept.

Unless you can get your "software filter" licensed by the FCC as a ham, it
cannot serve as a "control operator" for this purpose. The FCC states when
this has come up before (usually in regard to phone patches) that ALL TRAFFIC
which will be available "on-air" MUST have been screened FIRST by a LIVE ham.

I doubt anyone is going to take the time to read a "full USENET feed" on a
daily basis...

Further, there is a rule prohibiting use of ham radio to bypass "common
carrier"radio services, and if the FCC spots this use, they will "have a cow", in
the
current phrase. They do NOT want ham radio used by non-hams for routine
message traffic, that's what BUSINESS radio services and landline phone
is for.

Hmmm... I seem to recall a particular incident in the not-too-distant past
where certain NYC Taxicab operators were flagrantly using 10M SSB for their
commercial operation. The FCC field office there seemed to be less than
responsive on this...

Howdy:

I finally got together enough modified loader code so that we can bypass this problem with the DOVE S band modulator. Hugh Pett, VE3FLL, original author of the BOOTLOADER running on all four microsats, and I worked together for several days getting together a subset of the loader on board, and a modified version of the ground station bootloader exerciser.

The problem with DOVE has been caused by a failure (we believe of a silver mica cap) in the modulator for the S band transmitter. This failure caused the data modulation index to be VERY small. The total phase shift was much less than 180 degrees for a data 1. It was so small that no existing standard PSK modem (TAPR, PACCOMM, or G3RUH) could demodulate it. I wrote a DSP based demodulator that worked fine by moving around the place where the data was sliced. The problem with this approach is that I have a pretty good S band receive setup but not a great one. I couldn't give up the DSP modem as I was doing code development on it for AEA. I finally decided that the one and only weekend I could work on this was this coming weekend and I prepared to go to Boulder to the home of K0RZ. Bill has an outstanding S band setup and is a satellite afficionado. This put me so far into the doghouse at home that I became frightened into the solution that I should have come up with three months ago.

If we could just get a few hundred bytes into the spacecraft by ASSUMING when we heard any response it was an ack, then we could put in a loader that didn't have the faults of the one we flew. I made a mentat computation (in other words I hoped ;-) that if I heard a response from the spacecraft when I sent these ten packets the probability that the response was a NAK instead of an ACK would be low. Furthermore, since this code did NOTHING to the modules in the spacecraft around the transmitter, then the likelihood of doing something dumb

if one of the packets was a NAK would be low. The watchdog would just not be banged and it would reset back to the ROM or I would have to resend the reset signal. The only thing that could really go wrong is by some freak accident the 2 meter transmitter got turned on. I really did view this probability to be exceedingly small. So I risked sending code in the blind. The loader came up and from all indications functioned perfectly from the first try. Last evening, K0RZ hooked up a phone patch to his rig and I transmitted load commands to DOVE on two meters. I could easily hear the ACK (remember NAKS are no longer transmitted) and hit the `continue on with the next packet' key now built into the ground station loader code. I finished the operating system (kernel) in one half of a pass. This morning, I found the main problem with the S band system at my house (a lousy job on an N connector in the line between the S band antenna and the S band preamp). After I fixed that up, I was able to load half of the remaining code in two passes. Unless something is really wrong, I will be turning DOVE's 2 meter transmitter (145.825) on by this weekend. All appears to proceed normally.

>
>Let's not exaggerate. It is not TOTALLY ILLEGAL.

No, I agree with Skip that it is illegal, period, without an operator
viewing each message and approving or rejecting it for radio transmission.

There is more involved here than just "commercial" messages and the
seven words. The ARRL's FCC rule book does a pretty good job of
explaining the law with regard to "relinquishing control" - if you start
forwarding to Usenet, you are doing just that, aren't you?

If you could assure the guy on the other end is a ham, then that ham is
in remote control of your station and it's O.K. but third party traffic
of this sort should be carefully watched by the ham handling it.

My $.02.

Not so....I think if you look at it closely you'll find that this is ok
if you don't do it 365 days a year. To grossly paraphrase part 97 on
the subject it says something to the effect that it is OK to help a group
if the primary beneficiary is the public. The fact that the "sponsor"
(in this case the local PD) might benefit as an incedental to the
communication is not a problem. The point where you step over the line
is when you do this in a full time manner. This then would be helping
the PD do their thing in a "business like" fashion due more to the
duration of the operation than from what you where doing. Please
see the new FCC Rule book put out by ARRL. They specifically use
a "Goblin patrol" in the discussions of the subject.

The latest and greatest pe1chl net/ST and MS-DOS bits are available.
To obtain a copy, send a 720K formatted 3-1/2" disk, mailer, and postage to:

Mike Curtis wd6ehr@k6iyk

7921 Wilkinson Avenue
North Hollywood CA 91605-2210

I have prepared several additional docs on pe1chl setup, which differs
greatly from standard ka9q net.

The pe1chl net includes end-user multiport netrom, conference bridge,
NetDigi (a cross-port connected-mode digipeater); rcmd (operate your
keyboard remotely); KISS dual-port operation on multiport TNC's like
the KAM, KPC-4, etc., supports the evil DRSI board (PC version - it
actually WORKS!), ax.25 mailbox, and more.

  The KA9Q is a ham radio callsign. Armed with that knowledge you could also
have gone to a public library that has a copy of the ARRL ham radio callsign

directory and found his (or her) address and written them directly.

Try again Skip...
     Encryption of a message to be sent over amateur bands is
legal as long as your not using the encryption to hide the real
meaning of a message, Encryption/compression is ok if your
just trying to reduce bandwith/time to transmit a file.
This way you can send a .arc or .zip file over the air
with out it being called encryption. This however still
would not permit the orginal author to compress a message
to to clean up the "dirty words"

You might be taking something out of context. There are such things
automatic control, and this is what the software filter is. The FCC
rules do not literally say "live ham" but rather are defined in legal
terms that do allow automatic things under certain circumstances.
Read what those circumstances are. Don't just assume that because
something is not legal under some circumstances that it is also not
legal under other circumstances.

> I doubt anyone is going to take the time to read a "full USENET feed" on a
> daily basis...

Most certainly not.

                                                                ^^^^^^^^^^^
> for routine message traffic, that's what BUSINESS radio services and
> landline phone is for.

But since we are talking about use by hams, then this particular argument
would not necessarily apply. These USENET messages would really constitute
third party traffic and the rules that apply to it would apply here. Just
because the ends are non-hams does not in itself make it illegal; it just
invokes some additional restrictions, which most of USENET cannot adhere to
anyway. The restrictions are less if the destination is a ham, and this is
more likely what is being considered.

  No! You cannot intentionally obscure the meaning of text when using
amateur radio; codes and ciphers are expressly forbidden. On the other
hand, a filter (program) to delete commonly used foul language would be
rather straightforward, probably as part of the inter-domain router.

>   I did not know comercial messages by someone else would be illeagal. I
>have a scanner and have heard the hams tell they have stuff for sale and
>recommend stores. Could you explain this a little to the Neophyte...

  As I understand it, hams are permitted to engage in conversations
pertaining to ham radio. Most packet BBSes are loaded with "IC-761 for sale"
or "TR-2500 for sale or trade" messages. It is legal to sell, buy or even
discuss terms on ham equipment. I suspect this includes any kind of equipment
for amateur use, like "CoCo 3 for sale" (CoCo is a Tandy Color Computer).

>Feeding USENET by ham radio is technically possible (though difficult), but

  I'm not certain how difficult. I've been told the BM/KA9Q generated
messages aren't exactly RFC822 compliant so something like that, but that
probably isn't terribly difficult to fix on the fly.

>is TOTALLY ILLEGAL, due to the commercial nature of many USENET messages

    TOTALLY ILLEGAL? Hmmm... Almost every message I read on rec.ham-radio and rec.ham-radio.packet are non-commercial in nature. Even the kind of messages seen on rec.ham-radio.swap are legal, have you looked at the bulletin boards in your area lately?

>and the fact that regulations require a ham to screen ALL messages BEFORE
>they are transmitted to ensure no illegal traffic is sent, which would be
>a bit hard to do, unless you're a REAL speed reader.

   How does the automatic forwarding from BBS to BBS work? Does the control operator have to review all traffic to make sure it is legal? I think not. Same problem, already solved. The control operator is responsible and accountable for correct operation of his station. He may choose to read all traffic before forwarding it, or he may choose to take his chances.

>Bear in mind that international agreements that allow ham radio are created
>by governments, many of whom run government monopolies on telecommunications,
>and as such, prohibit ANY use of ham radio that "bypasses" phone or radio
>common carrier service, or is in any way involving the normal business of
>any person or business.

  Once again, I don't see how this applies to the generally trivial nature of the rec.ham-radio postings. You couldn't use a inter-domain gateway for a commercial purpose, but most of us don't use Usenet for commercial purposes.

   Is this for real? I find it very difficult to believe, given that the Police Departments are not commercial businesses (despite what people say about them being local revenue generators by writing tickets).

  Part of the charter of amateur radio is public service. I don't see how the FCC would reasonably dis-allow a public service like "Halloween Watch Patrols". I'd like to see a specific reference to the edict ruling assistance to PDs to be illegal.

Are YOU for real? The control operator is responsible for the operation of a station, the software he uses is no more responsible for the operation of his station than the wall socket the equipment is plugged into.

>I doubt anyone is going to take the time to read a "full USENET feed" on a
>daily basis...

I agree with this; but I don't think control operators of packet stations CAN or DO screen all traffic flowing through their station; what happens if someone is digipeating through my station - do I need to have MONITOR mode on and turn the TNC off if I see traffic of questionable nature? Hmmm..... nobody I know does that, so either there are a lot of criminals out there or you have some interpretation of the rules that is impractical and not being enforced.

>Further, there is a rule prohibiting use of ham radio to bypass "common carrier"radio services, and if the FCC spots this use, they will "have a cow", in the

>is for.

Once again, Skip, get with reality. The FCC restrictions have to do with the content of the traffic. The traffic must be of a trivial enough nature not to warrant use of a competing commercial service, and the intent must not be to avoid paying commercial services. This has little to do, for instance, with making rec.ham-radio.packet available via packet.

Skip, you very strongly state things without supporting them with proper quotes. My defense does not quote Part 97; but instead I take the position "this behavior is common". The assumption is if this common behavior really was illegal, we'd be hearing more about it. I do plan to go home and look at my copy of Part 97; I'd appreciate it if you did also before appointing yourself an expert.

The ka9q net is ms-dos, and will not run on an ST. There are several
ports for the ST that don't work for more than a few minutes before
bombing.

I'm running pe1chl's port of the ka9q net on my ST. Not only does it
run for a week or so before Atari's infamous folder limit catches up
to it, but it has many enhancements lacking in the ka9q net, such as
multiport gateway (NetDigi), conference bridge, rcmd (rlogin), type,
flow control that works, etc.

The message below has been posted several times here.

                    73, Mike Curtis

|_____|_____|

TCP/IP: PE1CHL NET FOR ATARI ST and IBM PC

I have been "volunteered" as the official keeper of the pe1chl bits for the U.S.

I have the latest pe1chl TCP/IP for both the Atari ST and the port to IBM PC and clones, and some additional documentation on them. Both versions support the KAM/KPC-4 as dual port KISS TNC's, conference bridge, NetDIGI, MHeard, end user Netrom, rcmd (remote command mode), TNC2 emulator (run net with rli/mbl PBBS with SCC interface, or PC under DoubleDos), and excellent implementations of the usual tcp/ip protocols. The MS-DOS version also supports the evil DRSI board.

For the ST version, send me a 720k double sided or 2 single sided 360k 3-1/2" diskettes, formatted, with postpaid, addressed mailer. Please specify Atari ST on the disk label.

For the PC version, send one FORMATTED 720K 3-1/2" diskette, with postpaid, addressed mailer. I do not support 5-1/4". Please specify MS-DOS version on the disk label.

Not exactly so - first, ham radio provides autopatch and phone patch, both
of which bypass telco; and NTS for passing messages, which bypasses
Western Union. These have been going on for years with the approval of
the FCC. The only thing that has been questioned is the "reverse
autopatch", which allows someone to phone in and call a ham on the air.
Here the issue is allowing uncontrolled access to amateur radio, not
bypassing other services.

Just thought you'd like to know - pete@puffin (k6jrr) is providing a
screened news feed to me, which I forward to several other tcp/ip
stations here on the packet duplex repeater. He personally checks all
mail for "dem dir-tee words", or anything else that could be a bone of
contention for the FCC to pick.....

It seems to me that, if usenet could police itself in the same manner
that amateur radio does, there would be no problem with an unsupervised
news feed.

Not a good idea. KA9Q is Phil Karn's call sign. He write the
"original" MS-DOS versions of the code. Other people then write the
variants, such as the Atari version. Walter Doerr DK2GG (or DG2KK?) did
one of the ST ports; a later one comes from somebody in Holland. A
better notesfile to ask in might be rec.ham-radio.packet.

> on both bands (let the 220 connect to the BBS on 145.05).
> I thougth about add route default ax0 ax1?

The pe1chl net for Atari ST and ms-dos supports the Kantronics
KAM and KPC-4 as dual port TNC's. It also has "NetDigi", end user
netrom, conference bridge, etc., that will work with many ports,
be they kiss, slip, or whatever. There is also a driver for an
external scc interface. I have schematics for the Atari ST.
the pe1chl ms-dos version also supports the evil DRSI board, and
actually works for weeks on end, unlike DRSI's net.
>
> Would it be easier just to connect the radios to the same TNC via
> the audio (more apt for collisons though).

Offhand, I think you'll run into problems, although I've not tried it.

I _do_ run 2 TNC's on a single radio, using analog loopback for collision
prevention, and to communicate between the 2 TNC's. However, that's
quite a different story :-)

If you'd like a copy of the latest and greatest Atari ST or ms-dos pe1chl
net, with extra docs (you'll need them - it differs greatly from ka9q),
send a 720k 3-1/2" diskette with postpaid addressed mailer to:

Mike Curtis wd6ehr
7921 Wilkinson Avenue
North Hollywood CA 91605-2210

and please note on the disk which version you need.

73, Mike Curtis

I imagine this question has been asked before -- my apologies to the
rec.ham-radio.packet readers.

I am looking for an SCO XENIX port of Phil Karn's KA9Q, or better yet,
the more recent update, NOS. I would also settle for -any- UNIX port of
either package. If anyone has heard anything, please let me know.
Thanks a lot.

That's silly, and I'm sure you're aware of this. The traffic that is
"digipeated" through you was originated by another ham -- another HAM,
who is presumably licensed. Digipeating, or repeater operation, is not
the same as third-party operation.

If you're automatically shipping out Usenet, you are putting non-hams
in control of what goes out of your station. You therefore have NOT
taken adequate precautions to prevent unauthorized use of your station.

Sure, automatic repeater operation is permitted...but third-party traffic
is a totally different issue, and the idea behind it is that THE HAM is
putting stuff on the air on behalf of another person; it is NOT that
the other person may use your equipment and it's O.K.

I would consider the sort of operation under consideration here as
very negligent, and would hope that this is a hypothetical discussion
(and that hams value their licenses more than to do this sort of thing).

(I'm just a little surprised that nobody's disputed how realistic a
"dirty-word-filter" really is; I don't think it's very practical at
all).

  However, most of the porting of Phil's code to the ST has been done by
amateurs in Europe, DG2KK and recently PE1CHL. Distribution of current
ST code in the US has been a problem, I've mailed out more diskettes than
I would have preferred because of this.

  Not only could you have gone to the library, but in northern California
anyway you could have used tcp/ip to finger the amateur radio database
which n6oyu runs and gotten the information via radio. Of course
if you only have an Atari that might require the very code you were trying
to get it ....

I don't know what the "official" story is, but you could argue that
you as the digipeater operator relies on the originating station to keep it
clean, since that station is under the same restrictions that you are.

Usenet doesn't have the same content restrictions, so the gateway station
can't rely on the feed from usenet to be compliant.

Ok gents, there is supposed to be a BBS program for the IBM called WWIV, it was written by a fellow HAM and was supposed to be intended for packet use as well as phone modem use. I have a copy of WWIV but no where in the docs or setup does it even seem to refer to Packet, let alone ham!

Anyone know anything? Help!!!!!!

Hams to lose all UHF Freqs?
July 1, 1990

     Sorry for the alarmist title but often it takes a knock
on the head to wake up.

As you know, ham radio recently lost 2 MHz of spectrum at
220-222 MHz. But did you know that in roughly the last TEN
years, ham radio lost an astounding 91 MHz! That works out
to 9 MHz per year from 1980 to 1989, making 1989's loss of
220-222 MHz a very good year for ham radio.

Between 1980 and 1989, the U.S. Amateur Radio Service
lost forever, a total of 117 MHz of spectrum in the VHF/ UHF
region alone:
     420-430 MHz north of 'Line A'.
     1215-1240 MHz .
     2310-2390 MHz.
     220-222 MHz.
The only good news is that we did get 902-928 MHz, for a net
loss of 'only' 91.00 Mhz.

What is so frightening about all of this is that the strong
arguments we presented to the FCC to save 220-222 MHz were
not good enough - and do you seriously believe that we can
provide better arguments to retain our holds at 902, 1240,

2400 or even 440 MHz?

Fast Approaching Demands on the Spectrum

Cellular telephones and high definition TV (HDTV) have all received a great deal of press regarding their growth and demands on spectrum. Lesser known are a number of new technologies that will start to come on line during the coming decade and which will demand their own frequency allocations.

Coming soon is the Personal Communications Network, which is best described as a 'micro cellular' system. The idea is that cells will shrink to less than 1 kilometer in size (in some cases maybe a hundred meters) as this is the only way that huge numbers of portable telephones can be accomodated. Conceptually every city block, every shopping center, every business will have a cell site. The single 'cordless phone' that you use at home will operate at your business, at the airport or while shopping. PCN is for real: A U.S. company has received FCC approval to build a pilot system on the east coast. Some systems are already operating in the U.K.

Even cellular is already maxed out in many areas. Today there are 3.5 million cellular subscribers with forecasts that the number will reach 28 million subscribers by 1997. That means that roughly 1 out of every 10 people in the U.S. will have a cellular telephone.

Path: N6QMY!W8GEC!KA6FUB!N6ECP!AL7IN!WB7VMS!N7DXT!N7JQK!W0LVJ!KD7NM

The cellular industry is looking to new technologies, especially digital cellular that will enable them to multiplex multiple signals, and hence, make better use of the available spectrum. Undoubtedly, they will want more spectrum.

Motorola has announced plans to build a world-wide satellite and terrestrial based cellular phone system. Using a large number of low earth orbit satellites, the system will provide worldwide telephone service from rural and remote areas of the entire world. When the user travels into a metropolitan area, the system will automatically switch from satellite

operation to the terrestrial cellular phone system.

Before the end of this decade, Digital Audio Broadcasting will likely make its debut. Just as FM broadcasting has nearly replaced AM radio, DAB may do the same, providing CD quality audio broadcasts. This digital broadcasting system will soon be seeking a dedicated frequency allocation, allegedly in the 1.2 to 2.0 GHz range.

And if that were not enough, virtually every single radio service currently in existence is seeking additional allocations.

The Impact

Last month (June 21, 1990 news report), Rep. Edward J. Markey (D-MA) introduced legislation forcing the Department of Defense to give up some of its frequencies. On June 18th, the House committee on Energy and Commerce unanimously approved a bill that would force the U.S. government to give up its hold on large segments of spectrum that it now holds.

Is this good or bad? Considering that ham radio shares frequency allocations with military radar allocations (go take a look at Part 2 of the FCC rules), this means that ham radio could easily lose significant chunks of spectrum. Only 430-440 MHz is an international ham radio allocation; 440-450 is US domestic only and is shared with military radar, as are 1240 to 1300 MHz.

Meanwhile, the Bush adminstration has gone on record saying that it favors the concept of selling 'access rights' to the spectrum. Industry analysts have said that market prices for 1 megahertz of prime spectrum might easily fetch 8 to 10 BILLION DOLLARS. Its hard to see how ham radio can compete with such dollar valued market forces.

Today, approximately one half of the FCC's employees are lawyers. How much do you think the FCC's lawyers value ham radio's contributions to packet radio technology, low cost

PACSAT satellite technology and other breakthroughs or even the unbelievably extensive public service of volunteer ham operators?

If all this isn't gloomy enough, restrictive antenna ordinances (the private ones NOT covered by PRB-1) are establishing defacto prohibitions on HF ham operations, at the same time that we are losing our VHF and UHF allocations.

Do we need VHF or UHF frequencies? You had better believe we do! Wide band modes such as ATV and high speed packet are only allowed at UHF frequencies. Packet networks and conventional voice repeater links and control circuits operate on these frequencies. Even if you do not personally use these frequencies, chances are good that the FM voice repeaters or the packet BBS station that you rely upon, all use these frequencies. Further, our future growth and experimentation of new technologies absolutely depend upon the availability of adequate spectrum. Even if you don't see the personal need for these frequencies, the Amateur Radio Service as whole is utterly dependent on these allocations for its future existence.

The Solutions?

Part 15 devices to save us?

Most hams do not realize that virtually all of our VHF and UHF bands are shared allocations, generally allocated to other services such as military radar. In effect, these are 'junk' bands that are incapable of serving the needs of paying customers.

We also share several UHF and SHF bands with unlicensed Part 15 devices, and strangely, the 'junk' nature of these bands may actually save them for ham radio. For example, 902-928 and 2400-2450 MHz are shared 'junk' allocations used also by Part 15 and Industrial, Scientific and Medical transmitters. For example, ordinary microwave ovens operate at 2450 plus or minus 50 MHz.

Right now, nearly a dozen companies are selling or will shortly be selling 1 watt high speed data transceivers in the 902 MHz band. These units operate spread spectrum and have claimed ranges of up to 10 miles; external antennas are allowed. Meanwhile, other companies are building digital cordless telephones on top of this technology. Since these data transceivers operate at a 200 kbps rate, its easy to use them as a basis for long range digital cordless telephones. I suspect we will see the first digital cordless phones, with

a 2 to 5 mile range, costing $400-$500 dollars by mid-1991, with shipping units by Christmas of 1991.

Other applications include non spread spectrum, very short range, wireless connections between VCRs and TVs throughout the house.

Fortunately, the FCC made it very clear that the Part 15 devices are 3rd class citizens here and must put up with interference. Especially noteworthy is that these Part 15 devices will be interfering with each other! In effect, the FCC has recognized that these are 'junk' bands and this may actually help save these bands for ham radio use too (but note that we may already have lost access to 920-928 MHz - see below).

Furthermore, there isn't any reason why a licensed ham radio operator couldn't add a 50 watt amplifier to one of these units and end up with a low cost, mass produced high speed digital data network - unless of course, the FCC bans the sale of 900 MHz amplifiers, just as they banned the sale of 10/11 meter amplifiers!

Increase our Numbers

Ham radio must increase its number of licensees. Between 1980 and 1990, ham radio grew at an average annual growth rate of 2%. That compares to growth in other radio services of many tens of percent per year. Since we are all competing for the same spectrum, guess who wins the request for more spectrum and guess who loses?

The issue over a no-CW class of ham radio license isn't one over whether or not a CW-illiterate license will obliterate ham radio. The choice is whether or not we want to share our VHF and UHF frequencies with licensed ham operators who have passed a technical exam but no CW test, versus losing those frequencies within the next few years to Landmobile and other services who are starving for allocatinos. Most of us would at least like to continue to have access to some of that

spectrum versus having industry slam the door in our faces.

The FCC, actually, has been extremely supportive of ham radio. But, based on our relatively low numbers, they cannot continue to justify our radio allocations against the demands of other services. The CW-illiterate license proposal may be their last opportunity for the Amateur Radio Service to kick us into significant growth. If this fails, or if the growth fails to materialize, there are literally hundreds of other services waiting for those frequencies.

The ICOM advertising department has perhaps seen another alternative to help spurn ham radio growth: during the past year or so, their ads have deliberatly emphasized hamming as an activity appropriate for the entire family. Not just Dad, but Mom and the kids too. Maybe the view of hamming as a life-of-leisure, sit back and talk to the world for hours on end, has become dated. Today, when Dad and Mom both work just to meet the mortgage payments, hamming is way to keep in touch and to enjoy social contact on the daily commute. We need to explore new concepts as to what, exactly, ham radio is going to become in the coming decade and in the next century.

Turn the ARRL into a political organization?

The ARRL must increasingly turn itself from a fraternal organization to a politically active organization, similar to the Sierra Club or the Aircraft Owner's and Pilots Association. These organizations both do an excellent job of motivating their memberships to write Congressman and to take an active role in preservering either the environment or access to the nation's airspace, respectively. The ARRL is currently very poor in this regard and needs to focus attention in QST and elsewhere on the real life political issues facing ham radio today. Most hams are largely oblivious to the technologies and political forces that will be raining upon us during the next decade.

The ARRL is our only national representative. I fear that in

the next 1 to 2 years, ham radio may lose additional UHF frequencies (portions of 902-928 MHz, especially 1240-1300 MHz, very likely 420-430 over the rest of the U.S., and potentially even 440-450 if military radar goes away) and that this could result in a backlash against the ARRL, and the rise of a second national ham radio organization. It is not at all clear that 2 voices would be better than one.

What to do?

I strongly urge you to discuss these issues with your ARRL Division Director and ARRL Section Manager and certainly other ham operators. Let's get the ball rolling and let's meet the challenges of the 1990's head on. Most of all - DO SOMETHING! Ask yourself that famous question: What are you, personally, doing to help promote Amateur Radio?

I welcome your thoughts and comments,
Ed Mitchell
KF7VY @ KD7NM.#WWA.WA.NA.USA

P.S. During the weeks that I have written this note, the 'hot' topics on the packet BBS network have been:
- code versus no code
- handicapped access without 13 or 20 wpm code
- closed repeaters

All of these are important issues. However, I fear that we are putting an enormous amount of emotional enery into arguing about the quality of each tree - while the entire forest is rapidly being cut down to make way for a new development!

Please, let's get some constructive dialogue going on the basic issue of ham radio existing at all!

----------END...AR----------

PLEASE REpost as you choose.....

>contention for the FCC to pick.....

Actually, I only handle 2 low-volume newsgroups this way (rec.ham-radio.packet
and ca.earthquakes) to 3 stations, with a 3rd very low-volume newsgroup
to one of the stations. Even rec.ham-radio is too high-volume for my
available screening time. (I'm using a mail-based gateway that forces
me to read each article to each station, so I see all articles 3 times.)

An nntp implementation with a dedicated spool would make things much
easier, but that hasn't showed up in "net" yet.

The reject rate for the above newsgroups is rather low.

BTW, mail to Mike's return address goes through the same gateway.

>It seems to me that, if usenet could police itself in the same manner

>news feed.

Really, you come up against the 3rd party rules here, which make not only
screening necessary but also extra logging and some other problems.
Policing is not the only issue.

> It seems to me that, if usenet could police itself in the same manner
> that amateur radio does, there would be no problem with an unsupervised
> news feed.

USENET already polices itself within reason.

USENET has a **DIFFERENT** set of "policies" to go by than Amateur Radio has.

Unless the FCC decides to let "anything go" in Amateur Radio (which I would strong oppose), that which is OK in Amateur Radio will always be some subset of that which is OK in USENET.

USENET is an umbrella net, and it is not inconceivable that it could even include Amateur Radio under it. But anytime a network really consists of other networks with different policies of what is and is not allowed, there usually needs to be a consideration of these policies. In MOST cases, there has not be much of a concern. One example of where there is such a concern is the DoD policy of not permitting "for sale" items over its network. This has lead to creation of a separate USENET newsgroup (rec.ham-radio.swap) so that these "for sale" items were not distributed over Arpa via the INFO-HAMS digest. Though this setup was not absolutely perfect, it basically did what was needed to be done.

Similarly, Amateur Radio has a "policy" and that is basically what is in the FCC rules. However this "policy" is not readily understood by most ordinary people, and is tough enough for hams themselves. Hams need to interpret the rules themselves because it is their own license that is at stake for violations. This means that UNLIKE the previously mentioned setup where for sale items were isolated and USENET was self policing, it is not likely that USENET can be able to "enforce" Amateur Radio policies in any way. Remember, people do not take an exam on FCC part 97 rules for USENET access.

While any ham who passes on prohibited traffic is technically in violation, the ham who introduces prohibited traffic into Amateur Radio is the most likely one to have to deal with the violations. Since this depends on tracking down which ham it is, each ham down the line still has certain

responsibilities.

I see no other way for a USENET feed gateway into Amateur Radio to take
place without some sort of filtering to ensure that prohibited traffic
does not make it into Amateur Radio. I also happen to believe that no
software can reliably filter this traffic. However, if the newsgroups
are limited to the Amateur Radio related ones (such as including some
like sci.electronics) then a simple software based filtering system MIGHT
be able to reduce prohibited traffic to a low enough level that PERHAPS
the problems of such traffic will be negligible, as interpreted by the
FCC (and the judicial system where applicable).

Filtering the seven dirty words, while certainly a necessity, is NOT
ENOUGH. For sale items must clearly be ham radio related. Any other
business related matter must be filtered out. Remember, "business"
includes more kinds of business than just "commercial business". An
exchange of information between charitable, non-profit, and/or public
services organizations CONSTITUTES BUSINESS (just not COMMERCIALLY).
Don't equate COMMERCE with BUSINESS.

Let's get REALISTIC!

As most everything else slowly moves off shortwave, there will be lots of
this spectrum for grabs. But the Shortwave Broadcasting service is going
to end up with most of it. Hams themselves are going to get some, but

nothing near 10 or 15 Mhz.

As a shortwave listener, I actually look forward to more SWBC spectrum.
As a ham I'd also like to see us get more, even though my interest in
shortwave is primarily as a listener. Nearly ALL of my hamming is on
VHF and above.

However, amateur radio is going to be judged. Those who are making the
decisions to allocate spectrum are surely not interested in allocating
any spectrum to the "shout, cuss, and QRM" service. While VHF and up
has these problems as well, we hear them in HF, and everyone else in the
world does, too.

Many of you may have heard the DOVE satellite last evening when I turned
it on two meters for the first time in three months. We are still having
problems but we are getting much closer to the solution. I have some
telemetry but I would like all you may have gotten. I would like packet
received confirmation if you claim to have heard it. I need to see the
telemetry. I can tell you from that which I have that the spacecraft appears
in excellent condition. The three bus voltages are all nominal. The array
voltage was nominal, the charging current was nominal and the output power
was 2.5 watts (I was being conservative!). I am dumping (on S band) the
DEATH_REASON byte (this will take many tries because of the S band modulator
problem) from the kernel. I hope this will tell us the answer. The last
word I have is that it was not heard on the next pass over the west coast.
We will almost surely find the problem this week and fix it. DOVE ON AGAIN
SOON.

Bob

/ hpfcso:rec.ham-radio.packet / ben@val.com (Ben Thornton) / 11:50 am Jul 5,
1990 /

   Is there a 6 Meter frequency that is used primarily for TCP/IP
traffic? I was thinking of crossbanding one of the NET/ROM nodes
in our vicinity and would like to know if anyone has any thoughts
or experiences to relate about this...

Ben
WD5HLS

Is there a primary frequency (like 145.01) for general 6 Meter packet
use. I've acquired an used crystal controlled FM rig that might be
fun to put on packet. It'd be a chance to work the openings without
having to keep checking the band - just check the heard list and mailbox
every couple days.

    Oh, gosh, Dad, that is silly, and I'm stupid enough to say it anyway. :-)
Quite frankly, I'm surprised that the FCC would not hold an operator
responsible for profane (or otherwise illegal) traffic, regardless of where
it originated from. I'm glad that I'm not responsible, but I am very surprised
and (seriously) DON'T THINK IT WAS SILLY FOR ME TO ASK THE QUESTION. Don't
be a snot.

>If you're automatically shipping out Usenet, you are putting non-hams
>in control of what goes out of your station. You therefore have NOT
>taken adequate precautions to prevent unauthorized use of your station.

    The more I've thought about it, I don't think I'd ship rec.ham-radio
or rec.ham-radio.packet out. In fact, the volume of traffic generated would
be too much. This leads me to further thought below.

>(I'm just a little surprised that nobody's disputed how realistic a
>"dirty-word-filter" really is; I don't think it's very practical at
>all).

    I don' think a dirty word filter is difficult at all; a profane language
filter may be quite a bit more challenging. A dirty word filter need only
"bounce" messages into a holding bin, for operator review. The problem is

bouncing profane material which does not use dirty words, or material which has an unacceptable commercial content.

Certainly, routing traffic FROM the packet domain to the "usenet" domain is not a problem. But, routing traffic from the "usenet" to the amateur packet domain is prone to the already discussed profanity regulations, but there is also the chance (very slight given the performance of 1200 b packet links) that a route may exist which takes traffic from the "usenet" domain into the packet domain and back into the "usenet" domain. This would start to look suspiciously like competition with the phone companies.

So, routing to the ham community becomes less and less attractive; but I still would like to send mail to hams from the usenet through an automatic gateway... how?

Make the gateway a request server. People originating traffic for the packet domain inside the "usenet" domain would send a request, including the text of the message, to a server. The server would then decide whether or not to forward the traffic. Once idea that springs to mind is the use of encrypted "usenet" text; the packet gateway server would decrypt the text and look for a certain form "letter", this in turn may contain special keywords in order to get repeated out into the packet domain. Another thought is that the packet to "usenet" direction may automatically encapsulate the packet traffic into encrypted usenet messages which use the "usenet" as a backbone.

Please keep in mind I'm suggesting that the traffic is only encrypted while in the usenet domain in order to obscure the mechanism used to prevent unauthorized access from the packet domain, I'm not suggesting that encrypted packets be sent over ham radio (I'm not that silly :-).

I've thought about it a little; the encryption of the data would have to be done with a relatively unique seed to be useful. If just one seed was in use, this wouldn't work well. Obviously.

I'd suggest that amateurs operating "usenet" to packet gateways would enroll users, much as a user gets an account on a computer. Traffic intended for retransmission in the packet domain would be encrypted, and the seed would be on a per-user basis and must have been previously agreed upon. It would be up to the amateur how to do this; maybe by a telephone call.

The amateur would probably still wish to "filter" the traffic for profanity or attempt to filter out other illegal content; "users" who violate the rules may have their accounts revoked. This is a non-issue for hams (like myself) who'd like to be able to originate and receive packet traffic via usenet.

I'd also like to apolofize to Skip Sanders for jumping on him. He was mostly correct, but a little strict in his interpreting of the rules. I certainly was not well-informed of the way the FCC handles digipeating of traffic, but I did make the correct assumption; the FCC makes a special case here.

OK. I bought a PK-88, wired the cable and hooked it up to my
MAC and my 2m rig. Everything's fine. I can hook up to people
using AX.25, access the local clubs PBBS and everything.

I now try putting it in KISS mode and using KA9Q. Now I've used
the KA9Q package before with a PK-232 (right?) and everything
was fine with, I believe, the same RS-232 cable. But everything
isn't fine with the PK-88. I've double checked the baud (9600) to
the TNC and loopback works.

Now this PK-88 has a simple KISS command that resets the
appropriate parameters to correct values for as long
as KISS is on. So my problems aren't with the parameters
for KISS mode. The KA9Q commands for AX.25 don't work either
so it isn't just a TCP/IP configuration problem.

Help.

Hey - I wasn't totally serious about getting 15 mhz of the HF bands. (then again, there is a God :-)). After I read that article about the demise of ham radio I almost barfed on my keyboard. It was so depressing and pessimistic I felt I had to post something upbeat.

BTW: I agree that we need more people getting involved in this hobby, but there is a flip side to the coin. Ever try to have a little fun on 20 mtr packet before ? It is a very frustrating experience. I believe that a major problem is dis-organisation and sheer ignorance of the people involved. You have alot, maybe hundredes of people all off by up to what, maybe 400 hz of each other - and total chaos is the result. It would not be a good idea to involve a whole s**tload of more new people into a mess like that. After using HF packet for a while, I wouldn't be surprised if the FCC banned packet radio from HF. It isn't very efficient is it ? Having said that, I am not impressed with operations on the VHF bands either. It leaves much to be desired. My point is that lack of a solid game plan and education is a major enemy to us, at least as far a digital communications goes. I joked to a freind the other nite that I think their should be 'regional SA's' for our packet radio network.

I also realize that there are other problems beyond the control of us operators, like not to great of a protocol, one hell of a lot of development all at once, etc - but I think the above is important.

I have donned the asbestos armor and am awaiting to hear replys from all you lovely people.....

If I read this right, it seems like you'd be making a list of hams that
you're "authorizing" to be in control of your station. Is this what you
are suggesting? Doesn't seem like you'd have the authority to do this.
(Ignore this point if I misunderstand you).

Having a list of hams whose traffic is O.K. to pass out to packet could be
fun, though. But I still don't know if I'd trust it, knowing how easy it
is to fake usenet message paths and sources.

Am I paranoid? Hmm, good question. I also keep my HT on "Tx STOP", in
case some idiot picks it up and starts pushing buttons (chances are that
said idiot would not figure it out fast enough to do any damage).

With all this stuff about getting news-feeds on the air, no one has
mentioned anything about getting just a mail hookup. How tough would
it be to handle SMTP mail traffic? What FCC rules would govern such a
gateway's use? Would the standard third party traffic rules apply?

Is it similar to the situation where a ham uses a phone patch to call
a non-ham? (Although this analogy is not complete, since, in this
case, the non-ham can originate as well as answer.) I also seem to
remember hearing that there are some technical problems with such
things since the ham TCP/IP network is disjoint (that is, each part is
not connected to every other part), is this a big problem?

With more questions than answers...

Hi there,

I ran a WWIV land line BBS for three years, and I don't think it is meant for
packet use. You could probably get it going, but it wouldn't support store and
forward, none of that is built in.

The guy that wrote it is Wayne Bell, and I believe his callsign is N6PLO. He runs a BBS himself, at 213-208-6689, probably your best bet would be to call him direct.

Good luck,

Before I get started on this tirade, let me emphasize that I laud the efforts of those who are trying to advance amateur packet radio. I just wonder about the direction we are going.

It seems to me that the goal of the amateur radio TCP/IP community is to implement a fully distributed network based on well connected peer stations. Ideally, there should be no central (read large, expensive, and vulnerable) switching stations like the phone company uses. This is of course based on the existing Internet. Unfortunately the Internet is NOT a good model for packet radio.

Let me postulate that most NODES on Internet are essentially large terminal servers. On the other hand, most USERS on Internet are connected to plain old terminal ports on the server, like the modem and serial port I am using right on the university VAX cluster. Traffic from the various users is bundled by the terminal server and routed to the Internet. Internet ONLY FUNCTIONS BECAUSE MOST USERS ARE NOT ACTUALLY CONNECTED TO IT. A great deal of parallel processing is provided by the terminal controllers of the various nodes. This is the only thing that keeps Internet from being swamped. (Sometimes, at least.)

This many-to-one concentration function is simply not technically or politically feasible for packet radio. We attempted to do it on VHF with half-duplex contention channels but this obviously has been a total failure. Half-duplex contention is extremely inefficient, and even it it wasn't, the channel bandwidth still has to be divided up among the many users.

Given the full duplex radios now on the market, I think it would be pretty straightforward to build 9600 baud full duplex radio modems using V.29 signalling. This eliminates the inefficency of the contention channel, but every user needs a dedicated frequency pair. This is impossible on the VHF/UHF bands because they are already saturated in metropolitan areas, where the most channels would be needed.

It's also difficult or impossible on the microwave bands because the terminal server needs an omnidirectional antenna pattern. Not every user would have a clear path to the server anyway.

Even if we could solve all the technical problems described above, who is going to pay for the terminal servers? On Internet, they are mostly funded by federal and state governements. Such vast quantities of money are simply not available to the amateur radio community. Even if it were, we are right back to central switching stations.

So we scrap the entire Internet concept of large scale terminal concentrators, leaving us with a distributed network of peer stations: just what the amateur radio TCP/IP community is working on. The existing Internet is implemented on point-to-point channels between nodes. This is easy to do with wires (given enough money), but not so easy to do with radios. The number of channels required for a metropolitian area demands microwave equipment again but finding a frequency and a clear path for everyone seems virtually impossible. And then how do you get between cities...

At this point, I would like to unveil some grand master plan to solve all the problems of amateur packet radio. Unfortunately, I haven't got one. It's easy to criticize the TCP/IP community but a lot more difficult to come up with anything better. I haven't got a general solution and I am not sure there even is one.

The easy way out would be to reduce our expectations. On the existing Internet, the user expects to be able to connect interactively, in real time, to any node on the network. This is actually possible since all the nodes are connected together with permanent high bandwidth channels. Most of the wonder and usefulness of TCP/IP comes from this ability to make real time connections to remote systems.

On amateur packet radio, channels are neither permanent nor high bandwidth. Perhaps it is then only reasonable to expect a reliable email system, with real time connections only possible within limited areas. TCP/IP is then perhaps no longer appropriate and better solutions may be possible.

Let me reemphasize that I am not attacking the TCP/IP implementators. Telnet and FTP are nifty and wonderful but I have to wonder if a really efficient and reliable email system would be a lot more useful in the real world of amateur packet radio.

>The internet and the tcp/ip packet radio network that emulates it is
>a huge collection of terminal servers, etc.

If I were to accept your view of what the real world of packet radio,
and what the internet is, I'd have to admit that your arguments make
sense.

But I don't want to limit myself to that view. I want more.

I want closely-coupled distributed computing, databases, communications.
I want to play chess against your computer while you challenge mine. I
want digital voice, images, text, printed pages. I want to see if I can
be in two or more places at one time with virtual realities. I want to
span space and time - visit places I can never go. I want to see the
Earth from orbit, travel undersea, hear the winds in a ballon as I
control it from my easy chair. I want to know if the Cokes in the
machine down the hall or across the planet are cold yet. What's the
weather like in New Jersey, or off the end of the Scripps Pier?

These are only a few of the things that can be done with an experimental
digital network. Some of them are history, some are happening now; some
are a few years off. Some might never happen - but we'll never know
until we try.

Please, oh please! don't try to make everyone equal by cutting them all
down to a uniform size. It is the dreamers, the experimenters, the
imaginative few who are willing to try to do the impractical, the
impossible, the glorious - these are the kinds of people we need most in
ham radio - nay, in society!

And think, even if only one or two of us succeeds only in 1% of what we're
dreaming of doing, even unimaginative uses of the network will be all
the better for it.

Please don't take my toys away, Daddy. I don't want to go to bed yet.
     - Brian

> BTW: I agree that we need more people getting involved in this hobby, but
> there is a flip side to the coin. Ever try to have a little fun on 20 mtr
> packet before ? It is a very frustrating experience.

Yes, it is - due to the following, listed in order:
1. Too many packeteers jammed into a couple of frequencies
2. Not enough frequencies to accommodate the many packet users
3. 20 meter packet is normally too crowded to allow efficient 300 baud
   packet (is that an oxymoron or what? ;-)

.... (edited for levity.........;-)

25. Too many hams on 20 meter packet at the same time
26. Dorky beacons (HIEEE! CONECK TOO MY STUPED STAITION AN SCREEM A MESSEGE
    MOOR INSIPIDLY IDIOTIC THEN THIS WON! DE FRANK, PROFFFESSUR OF ENGLESH)
27. Fading (QSB)
28. Poor parameter settings

(Please note the relativity of the first 25.......)
If you've ever been on 20 in the very early morning, when it's not crowded,
you well know what I'm talking about. 300 baud HF packet is quite nice
for keyboard to keyboard sessions and lightweight FTP when QRM is minimal.
We have gateways to 15 and 20 meters here on the L.A. duplex packet
repeater, and I route to HF station via these.

If you've had the pleasure of running 10 meter 1200 baud when the band is
open, you realize the potential HF has for packet.

What I'd like to see is:
1. Greatly expanded 300 baud packet frequencies on all low bands.
     We could double our current frequencies by using 1 KHz separation
     and 500 Hz filters in our SSB rigs. This would greatly help HF
     300 baud congestion.
2. 1200, 2400, 4800, and 9600 baud operation in the phone bands.
     1200 baud AFSK packet uses a top frequency of 2200 Hz, and would
     do just fine on HF SSB. 4800 FSK (_not_ AFSK), using the traditional
     NRZI packet format, has a top frequency of 2400 Hz. Both of these
     fall easily within the 2700 Hz theoretical passband of SSB voice.
   The k9ng 9600 baud modem could be used with only a little greater
     passband, i.e. 4800 Hz. Also realize this - even though the k9ng
     modem is operating 8 times faster than a Bell 202 TNC-2 modem, true
     FSK gives the k9ng a significant 15.5 db BER over the AFSK Bell 202!

> ....   I believe that a
> major problem is dis-organisation and sheer ignorance of the people
> involved. You have alot, maybe hundredes of people all off by up to what,
> maybe 400 hz of each other - and total chaos is the result.

I disagree!!! Check the operation on 14.103, 14.105, 14.107, et al, and
you'll find a remarkable adherance to our unofficial channels. BTW, if
you do as most TNC manufacturers recommend and use a 500 Hz CW filter,
these 2 KHz slots could easily be cut to 1 KHz spacing with no adverse
effects - in fact, you'd be better off than someone using a 2.3 KHz phone
filter with 2 KHz spacing! (Try it sometime....)
> ....   It would not
> be a good idea to involve a whole load of more new people into a mess
> like that. After using HF packet for a while, I wouldn't be surprised if
> the FCC banned packet radio from HF. It isn't very efficient is it ?
If you're the one sitting there for a couple of hours trying to get a
half screenful of text through - no. If you compare the amount of info
that flows on a skinny slot like that with 50 baud AMTOR (yawn) or 45 baud
Racketty teletype (double yawn), that's another story....

> Having said that, I am not impressed with operations on the VHF
> bands either. It leaves much to be desired.

Yes it does! A major improvement could be made if non-MFJ TNC owners
would install $20 DCD state machines in their "alligator" TNC's. Then they
could run their radios unsquelched, and keyup delay would be minimized.
Also, the modems seem to demod better, if you can believe that. Perhaps
less garbage from squelch delay and tail??? My IC22A has a squelch that
takes days to open, unless it's set right at the threshold.

> I also realize that there are other problems beyond the control of us
> operators, like not to great of a protocol, one hell of a lot of development
> all at once, etc - but I think the above is important.

Yes - the biggest problem is using a stinking rotten modem design. Why
do we insist on limping about with audio tones through a voice radio?
(Yeah, I know it's easier to plug into your voice rig, but getting onto
packet, even ax.25, is not an easy thing, even for us engineers..)

This is lousy at best. True frequency shift keying has been proven to
work orders of magnitude better! It's also very easy to implement on
a cheap crystal-controlled radio - just pop a varactor across the transmit
rock! If the transceiver has a discriminator (most do), pick up demod'd
FSK directly from the discriminator. It's easier than Folgers Crystals!
(Pun intentional)

Speaking of phone patches, I've never seen a patch that DIDN'T bypass
the phone company. Bypassing Ma Bell seems to be largely a non-issue
with the FCC; therefore a usenet feed to ham packet would not be a problem
based on this.

What WOULD be a problem is business-related communications, and profane
and/or indecent language. I guess some people would be limited to a 4-word
vocabulary without said language.

>   I also seem to
> remember hearing that there are some technical problems with such

> not connected to every other part), is this a big problem?

Well, the tcp/ip network is not as contiguous as we'd like, but mail
can be forward via the ax.25 network worldwide. It may take a week
or 2 sometimes (usually a day or so in the USA, and a couple days to
Europe), but it eventually gets where it's going.

Some portions of the mail forwarding network are quite slow - 110 baud.
Much mail is shipped over dedicated forwarding frequencies like 14.111,
at 300 baud, etc.

We're working on some higher speed links, i.e. 9600 baud, 56 KB, and
faster. We'll also have a 9600 baud group on 2 meters in the L.A.
area soon. TAPR's much-rumoured packetRADIO is going into beta testing
and will have a k9ng-format 9600 baud modem, 2 meter radio, and an
optional TNC2, all in one box. Once that's done testing, can MFJ be
far behind in licensing and building these?

In the foreseeable future, we'll quite likely have multi-megabit
links for mail/ftp/netrom (??), etc., on amateur radio.

     Yes, but suppose that the various governments stopped paying for the high speed dedicated lines that Internet runs on? If everyone on Internet had to get by with dial-up telephone lines would it still work? Now let's take away all the expensive multiuser computers on Internet and give everyone a PC and a (radio) modem, increasing the number of nodes by a factor of 100. Would it still work? Is TCP/IP still appropriate? Isn't this what the TCP/IP community in amateur packet radio wants? At least think about it.

As for wanting good, reliable, working email....

hate to break the news, but the Internet world
invented it, and still provides the best,
most ubiquitous service. sure there are serious
problems (I know - I participated in the effort which
produced RFC-822), but boy, in the world of working,
useful services, it is soooo fine.

so if you really want email that works, having been developed
over 25 years of in-the-field engineering and abuse,
guess what you run???

ax25 ain't it, buster!

My "dreams" are much more simplistic and limited - I'm working on a
very preliminary concept of multi-megabit mountaintop trunks feeding
many low-level cell sites with a 56kB downlink, who would then use
selectable 1200, 9600, and 56kB to end users.

The microwave "repeaters" would be point to point, and would be handling
mostly data from the rest of the network. Additional data from the cell
sites would be mux'd into this data stream.

Users on any cell site could "connect" to any other cell site in the
system, and from there connect to another end user.

Sounds a bit like high-speed TEX-NET, doesn't it?

I'm also trying to get a 9600 baud end user frequency for 2 meters. It's
an uphill battle. there are those here who want everything on 2 meters
for 1200 baud, even though 9600 baud k9ng format @ 3 KHz deviation requires
only 12 KHz bandwidth and easily fits within a 20 KHz channel! (BTW, we've
seen quite a few 1200 baud stations that are using MORE than 20 KHz because
of improper radio/TNC adjustment!)

> ham radio - nay, in society!

Yup - and there are always the nay-sayers standing in our way, i.e. Who's
going to buy all this microwave stuff? Don't you know it's expensive?
And besides, what we have right now works just fine, thank you! I can
type to my buddy down the street just fine.

Well, microwave _can_ be expensive, but underused technology usually is.
I remember the first electronic clock. It was $1500.00, and had LED's
in a circle, like the face of a clock. It told hours and minutes.
I can now purchase a much smaller, more sophisticated DIGITAL watch for
under a buck! So it's totally realistic to expect microwave stuff to
come down in price as demand becomes greater.

And what we have now does _not_ work just fine. If you want to transfer
a decent size file on 1200 baud packet, expect it to take all night, _if_
it goes at all.
The ax.25 users cry up a storm over tcp/ip "hogging the channel". And
they're absolutely right. We _do_ hog it! The amount of information in

and out of my station is incredible, as far as ax.25 users are concerned.
Something that's intended to be adequate for what basically amounts to
shared frequency RadioTeletype (RTTY) will fall far short of adequacy
for a LAN.
>

Yes, again, Brian!!!
What skin off your collective noses is it if a bunch of us nerds wants
to try something that won't work?

Remember the bumblebee. Do you realize that it's scientifically impossible
for him to fly? But the bumblebee, being totally ignorant of scientific
fact, ...

Perhaps Albert Einstein said it best:
What we know about the Universe, compared to what there is to know, is
like a man who desires a closer look at the Moon, so he climbs onto
his roof.

My favorite bumper sticker (at least while composing this) would have to be:

LEAD, FOLLOW, OR GET OUT OF THE WAY

>(Ignore this point if I misunderstand you).

    I'm not clear just exactly how to word this, but I think this is a case
    where I am a control operator putting together an automatic station
    with safeguards to prevent unauthorized use. I think (and I could be
    wrong here) I have the authority to do this.

>Having a list of hams whose traffic is O.K. to pass out to packet could be
>fun, though. But I still don't know if I'd trust it, knowing how easy it
>is to fake usenet message paths and sources.

   The reason for keeping data encrypted while in the usenet domain is
   to prevent such abuses. Even if someone were to forge mail from an
   enrolled user, they would have to encrypt the text of the message with
   the correct seed (password). It isn't just a list of OK hams; it is a
   list of "user names" and "passwords".

   I should clarify; I'm not suggesting that the data be sent into the
   packet domain still encrypted; the gateway would decrypt the text using
   the password, and check for a valid message (with some kind of internal
   checksum or message format, or some combination of these). Only valid
   messages, in pure text, get sent out.

Yes, it still works. The UUCP world works fine as well, thank you
very much. Most people have advance beyond 1200 baud to 2400 or
9600 or 19.2Kbaud. Such modems for phone lines cost $100-$1000, or
less than the average HF radio. (Anyone connected a Trailblazer
over an RF duplex dual-band radio to see how it does???)

As for The Government paying for the lines, things in the Internet
world are changing along those lines and many people are more than
willing to pay for real network service. Even in the UUCP world,
more than 1200 people or organizations are willing to pay
money for a direct connection to UUNET even when they could get
some of the stuff via a local phone call.

Other than historical (hysterical?) accident, there is no reason
to be using 1200 baud on radio, particularly VHF and UHF.
The first 1200 baud modems were cobbled-up from available parts
(actually surplus Bell 202 modems connected to radio audio connectors).
If they had been 9600 baud units, we'd all be at 9600 baud
and people would be complaining that there's no need for
a megabit, instead of complaining that there's no need for 9600.
So, while the appliance TNCs out there are indeed 1200 baud,
the folks I know who started it all would have never done it that way
if they had forseen it would be so hard to move people forward.
(We've had this conversation many times....)

TCP/IP and telnet, giving your basic AX.25/TNC capability isn't
complex. In fact, it has been done in a mask-programmable
6502-type ``toaster-controller'' chip designed to plug into a standard
UART socket so an ADM-3A terminal could speak TCP/IP. Regretably,
this part didn't get to market because the fellow who did it went

off to be chief scientist of a networking company.
So a TCP/TNC *could* be done if people are interested enough
to work on it.

But then that's how packet got started - some enterprising
people were interested enough to DO something, not just
talk about it how what someone else did isn't adequate.

     -Mike
      N4NLN

[Me again]

     Some clarification is in order. I was attempting to say that most
users on Internet do not have a dedicated node, with the address, comm
channels, and processing that includes. Most Internet users log on to big
multiuser systems that are funded by various governments, like the VAX
cluster I am logged onto right now. I called such a beast a "terminal server"
or "terminal concentrator", because I use very little of its processing
power, while on Internet. Apologies for bad choice of terminology; as Phil

Karn indirectly points out, these phrases have more specific meanings in the data communications industry.

My whole point about the terminal server idea is that Internet may be more dependant on the few large multiuser systems than we might like to believe. What happens when we increase the number of nodes by 100 or 1000? Even 10000 if we managed to every ham on the planet on TCP/IP packet. I am not sure ANY protocol can support a network of 100,000 sparsely connected peer nodes (nodes that get turned off a random intervals, no less), at least in real time. And that's only a tiny percentage of the current ham population. (International of course, especially Japan.) My observations have been that Internet as is doesn't function at peak times with only a few hundred (maybe a few thousand by now) nodes.

Internet may have orignally been intended for radio but what is currently installed is absolutely dependant (I believe) on the leased lines and microwave relays that are again paid for by various governments. To duplicate this, every ham on packet would have to install at least 2 or 3 dedicated microwave (or VHF/UHF) data links to his near neighbors. (Here in Alaska I don't have any near neighbors!) It seems to me the chance of finding a clear path and/or frequency for everyone is pretty remote. And what about between cities? And who pays for all this stuff?

To summarize my argument, I claim (am afraid) that the Internet architecture depends upon

1. Large multiuser computers, which are paid for by various government agencies. (A few are also privately owned.)

2. Dedicated and permanent communication links, which are also funded by governments. (Some are private or donated.)

for its real-time performance, which is what everybody likes and expects. The real-time stuff in TCP/IP is what everybody raves about, but I am not sure it can deliver on the promise in the amateur packet radio environment.

I have never suggested AX.25 is any kind of solution. My opinion is that the very idea of shared frequency packet was flawed and that sharing by contention was even worse. (I am talking long term solutions here; 2m AX.25 was and is amazing but it's a dead end). Putting TCP/IP on top of it isn't (I believe) going to help very much.

What I am suggesting is that everyone better prepare to buy a lot of microwave gear to make TCP/IP work properly, in real time. This is not necessarily a bad thing, but it isn't trivial either.

What we will actually get (I believe) is a system that will only supports real time TCP/IP operations for small areas and some sort of email to patch these areas together. I doubt that we will ever achieve enough connectivity to allow real time operations over wide geographical and especially rural areas. Again, this is not necessarily a bad thing, unless you live in Alaska.

To use an analogy, there are still many people here in Alaska who don't have a telephone (admittedly fewer all the time) but can still go to the nearest village to get and send mail. The question is do we build a fantastic new telephone system connected to only a few big cities or do we build a fantastic new postal system that everyone can use? The ideal case is to build a fantastic new telephone system that goes everywhere but the world is hardly ideal.

NOTE: Before everyone tries to incinerate me, go back and find all the places I said "real time." It is my only real reservation about TCP/IP. Show me how we can achieve real time operation over wide areas with it. I'm not writing this just to give the TCP/IP people a bad time; I really am concerned (and with a rural viewpoint).

It is difficult to respond to many of Phil Munts's comments because many of them either attack straw men or belie a basic misunderstanding of the Internet architecture, but I will try.

> Unfortunately the Internet is NOT a good model for packet radio.

A little-known fact: the entire original motivation for the development of what became TCP/IP was the desire of the DoD to transparently interconnect the ARPANET with the various DARPA miliary packet radio nets. This was several years before the invention of Ethernet (which was itself originally described as "packet radio on a cable"), so it was only natural that TCP/IP would find wide acceptance on local area networks. And it is only natural that TCP/IP would

eventually come full circle and be run on amateur packet radio as well.

I also point out that the other protocol "stacks" that run on interconnected LANs, e.g., DECNET, XNS, Chaos, Appletalk and OSI, all share the same basic architecture as TCP/IP. The differences are mainly in the details. (Of course, it might be more accurate to say that OSI is unique in that it runs mostly on paper, not LANs, but I digress...)

> Let me postulate that most NODES on Internet are essentially large
> terminal servers.

This is an incorrect postulation. Almost all nodes on the Internet are general purpose computers ranging from PCs up to Crays. The majority run some variant of UNIX. Terminal servers are a small fraction of the hosts on the net. They provide what is basically a backward compatibility function that allows existing dumb terminals to do what they have always done: to log into a remote computer.

But this is not what the Internet was primarily designed to do. The Internet is a COMPUTER network, not a TERMINAL network. This is a fundamental issue that is often not grasped by those who try to compare it with X.25 nets, terminal switches and the like. Many of the applications supported by the Internet make sense only in the context of computer-to-computer communication. How does a dumb terminal use a "file transfer" protocol?

Those who know me know that I long resisted incorporating "terminal server" functions into my code because I believed that that approach was architecturally "unclean" and hides much of what the Internet has to offer. However, recently SM0RGV has added such features to the mailbox subsystem he contributed to my package. A "plain" AX.25 or NET/ROM user can connect to NOS and initiate a TCP/IP Telnet connection over the Internet, and vice versa. I now agree that this feature is useful in giving regular AX.25 users a small taste of what a real TCP/IP node can do, hopefully encouraging them to become full-fledged TCP/IP users.

> Internet ONLY FUNCTIONS BECAUSE MOST USERS
> ARE NOT ACTUALLY CONNECTED TO IT. A great deal of parallel
> processing is provided by the terminal controllers of the
> various nodes. This is the only thing that keeps Internet
> from being swamped. (Sometimes, at least.)

I'm not sure of your point. Are you saying that the use of a terminal server instead of a computer somehow removes load from the network? This doesn't make sense. Terminals servers are merely specialized Internet hosts that provide a single application, namely remote login. Personal computers directly attached to the Internet (e.g., a Sun running SunOS or a PC running NOS) can provide exactly the same service to their local users. From the Internet side, these two types of systems (the terminal server and the PC running Telnet) are

completely indistinguishable.

The difference, however, is that the computer user has the option of using many other applications besides remote login. Many allow him to do his tasks much more conveniently AND WITH LESS NETWORK LOADING than if he were forced to do them across the network on a remote timesharing system. For example, a user with a personal computer or workstation can conduct an email session by transferring his mailbox file across the network to his local computer where he can read it and compose replies offline. Then he sends his replies back out in what are essentially a series of automated file transfer operations. This makes *far* more efficient use of the network than the "dumb terminal" approach. Not only are all of the user's editing commands kept off the network entirely, but the data that *is* sent goes out in a few large packets instead of many small packets.

And most important of all, the user need not sit there and twiddle his thumbs waiting for each packet to be sent; his PC can receive his mail before he even sits down to read it, and his replies can go out automatically after he gets up. I receive all of my PBBS mail via a TCP/IP relay from NN2Z; it's there with the rest of my Internet mail, and I compose and send responses in exactly the same way. I don't understand how hams can tolerate interactive PBBS operation at 1200 baud. If that were my only choice, I wouldn't bother.

|>   This many-to-one concentration function is simply not
|> technically or politically feasible for packet radio. We
|> attempted to do it on VHF with half-duplex contention
|> channels but this obviously has been a total failure. Half-
|> duplex contention is extremely inefficient, and even it it
|> wasn't, the channel bandwidth still has to be divided up
|> among the many users.

Now I think we're getting to the crux of your argument, which is that the channel access/sharing algorithms we're currently using for amateur packet radio don't work very well, and that the many-to-many mode of operation characterized by the Internet protocols aggravate the problem in comparison to the many-to-one style characterized by PBBSes. Right?

Well, you're certainly correct on one point: our channel access algorithms desperately need work. But this issue is completely independent of what protocols you run at the higher layers! The whole idea behind a layered protocol architecture is modularity and interchangeability of the various components. If channel access is the problem, then fix it! Don't hobble the development of the upper layer services instead. There are many approaches toward making our shared channels more efficient: Ethernet-style CSMA/CD through crossband repeaters that allow stations to detect collisions while transmitting; Appletalk-style CSMA/CA, which restricts collisions to the small "request to send" packets that start an exchange, and perhaps even ARCNET-style token passing or polling. And yes, point-to-point microwave links such as those being developed by N6GN, N6RCE and N3EUA

also have tremendous potential in certain situations. Why don't you lend a hand to this effort so we can find out the relative advantages and disadvantages of each approach?

It's quite likely that there will be no one clear winner, so we'll end up with a hybrid network in which different approaches are taken to different problems. And this is where TCP/IP really shines: interconnecting dissimilar networks in a way that's transparent to the applications.

> So we scrap the entire Internet concept of large scale
> terminal concentrators, leaving us with a distributed
> network of peer stations: just what the amateur radio TCP/IP
> community is working on.

Once again, this is a straw man. There is no "internet concept of large scale terminal concentrators". I had no intention of providing them in the first place, so there's nothing to scrap. At best, they're a temporary stopgap provided for backward compatibility with dumb terminals, or for "marketing purposes" in encouraging more users to discover why they should get on TCP/IP themselves.

> It's easy to criticize the TCP/IP community but a lot more difficult
> to come up with anything better.

Truer words were never spoken, as the OSI community is only now discovering.

>   On amateur packet radio, channels are neither permanent
> nor high bandwidth. Perhaps it is then only reasonable to
> expect a reliable email system, with real time connections
> only possible within limited areas. TCP/IP is then perhaps
> no longer appropriate and better solutions may be possible.

This doesn't follow. It is entirely true that our channels are imperfect. But you forget that this is precisely the kind of environment for which TCP/IP was originally designed! Many of the basic design decisions in TCP/IP, e.g., the choice of the datagram model and the emphasis on distribution, were driven by the DoD's desire to keep bits flowing even when nodes on tanks, jeeps and airplanes move around, get jammed and/or blown up. Our requirements aren't as dramatic, but the same features make TCP/IP well suited for the research, commercial and yes, amateur packet radio worlds.

And TCP/IP is certainly more appropriate than the connection-oriented approaches such as X.25. Of course, even robust, flexible protocols like TCP/IP can't turn a sow's ear channel into a silk purse. But they do come close.

> I have to wonder if a really efficient and reliable email
> system would be a lot more useful in the real world of
> amateur packet radio.

Why does TCP/IP preclude your "email system"? Mail is one of the major uses of the Internet, and not all of it flows directly between original sender and final destination. The Internet mail system supports mail relay points called "mail exchangers". These closely resemble, in principle, the store-and-forward network of amateur PBBSes, except that the Internet mail protocols are much better thought out, far more flexible, and more reliable and efficient.

In summary, the Internet is much closer to amateur packet radio than you might imagine, and it is the best model we have. There certainly are problems with the lower layers in our packet radio networks, but solutions exist that do not require that we discard the flexibility and power of the Internet protocols.

Phil

Version 2.10 of the AA4RE BB program is now available.

The primary advantage of BB over the MBL/RLI/BQE/CBBS.... systems is the ability to handle multiple connects per port. The program uses it own multitasker and no DesqView, DoubleDos, etc is required. On the down side, BB has been optimized for speed and requires at least 512K (and usually 640K) to be used productively.

BB uses a "host-mode" interface so the only TNCs supported are the TNC-1 and TNC-2 (or clones) with the WA8DED (or clone) EPROMS installed, the AEA PK-87, PK-88, PK-232, and the DRSI PC*PA TNC card. It also runs with any KISS TNC using the G8BPQ PC Node switch.

You can get these programs by sending a $5 US (or equivalent) to:

 Dave Larton, N6JQJ
 766 El Cerrito Way, #D
 Gilroy, CA 95020-4149
 (408) 847-3605

For source code, include $2 more (needs multiple diskettes). Between
Dave and I, we can handle all formats of 5 1/4 and 3 1/2.

The software can also be obtained by downloading from the following BBS:

   WA6RDH BBS at 916-678-1535 (300/1200/2400/4800/9600 N81)
   The W3IWI TOMCAT TCPIP server

Those with FTP Internet service or BITNET should send a note to AA4RE @
AA4RE.#NOCAL.CA.USA.NA with your TCPIP address (eg. 123.213.22.33) or
BITNET address for delivery over those networks.

SYSOPs running 2.9 should obtain 2.10 as soon as possible because of
potential BID problems with the alternate header length.

In article <1990Jul11.180406.728@hayes.fai.alaska.edu>,
ftpam1@acad3.fai.alaska.edu (MUNTS PHILLIP A) writes:
> Yes, but suppose that the various governments stopped paying for the high
> speed dedicated lines that Internet runs on?

This is already happening. The various NSFNet regionals are only
partially subsidized by the NSF. JvNCNet, the one Bellcore is
connected to, charges its commercial members their full share of
network costs; only the educational institutions are subsidized. It is
true that the backbone net is still fully funded by the NSF, but this
is likely to change over the next few years. (The backbone net also
accounts for a smaller fraction of the Internet's total cost than you
might think.)

> If everyone on Internet had to get by with dial-up telephone lines
> would it still work?

Certainly not as well. That's why the Internet was built in the first place, because dialup telephone lines were built for voice, not for high speed computer-to-computer communication. If everyone had been happy with UUCP, the Internet would never have happened.

You should also know that the success of the Internet has not gone unnoticed by the telephone companies. The Switched Multi-Megabit Data Service (SMDS) is a service concept that would provide "Lan Interconnection" (the telco term for internetworking) on a commercial basis. If you're interested, several articles on SMDS by Bellcore and BOC authors have appeared in the literature.

> Now let's take away all the expensive multiuser computers on Internet
> and give everyone a PC and a (radio) modem, increasing the number of
> nodes by a factor of 100. Would it still work? Is TCP/IP still
> appropriate? Isn't this what the TCP/IP community in amateur packet
> radio wants? At least think about it.

What's an expensive multiuser computer? There are already several UNIX systems on my local amateur TCP/IP network, and as prices continue to drop I expect many more. And you don't need to run UNIX to use TCP/IP; my code runs under MS-DOS and provides both server and client facilities.

And given the right mix of radio modems and channel access techniques, yes, I think we could easily support a 100-fold increase in amateur packet radio nodes. We won't do it with 1200 baud on 2 meters, though.

Maybe I am missing something obvious here, but I don't see what the big deal is.

I *do* see a strong tendancy for hams to turn into armchair lawyers, and forget the intent of the regs.

The issue of profanity & "encryption" is an old one. Have any of ya'll seen the old rtty "pictures" of nude women that used to be the rage on HF?

Were they profane? Most were... Did the violate the regs? nope.

These "profane" images were encoded, not "encrypted" as clever lines of characters. they did not transmit "dirty" words, so they were ok. I never heard a case where anyone was told otherwise.

A major magazine publisher brought up the point that hams should now be sending music over the air. Oh no, we say!

He goes on to explain that digitally stored music, such as that on a compact disk, would be legal to send as a file. It is *not* encrypted, it is encoded in a published format. The intention is that ham radio not be used to *broadcast* music. Nor is a "cipher" used to obsure meaning or intent. It is data, nothing more. The intention is met.

An hdlc frame is encoded. I view uuencode, and file compression the same way. Treat it as a modulation technique. Think about video. It is images "encoded" to allow transmission in a certain bandwidth.

Let's carry it further... would it be illegal to ftp over packet an executable that printed out "dirty" words. Or pictures? does this mean I cannot ftp Leisure suit Larry to my friend. (Copyright discussions aside.)

I don't see how we can prohibit this, yet allow the things that are said on 75, 20, and 2 meters all the time.

I believe the intention of the reg, was that a listener on that frequency should not hear profanity. Commercial broadcast stations sure play word games at will, having lots of lewd/"dirty" discussion, with nary a prohibited word. If we are going to deal with "intent" rather then the word itself, then SOB, darnit, shoot, etc will all have to go.

I would view batched, compressed usenet feeds in the same light. I would probabley not include the obvious for-sale groups, but I have a filter that cleans all the profanity I can think of nicely.

Is it "transmitting profanity"? No.
Is it facilitating "pecuniary" interests. I have not seen any.
Most groups *are* as strict on commercial traffic. filter the *.for-sales and you get the lion's share.

Oh well, maybe I am confused. I do think hams like to invent stumbling blocks for ourselves. The "music on hold" autopatch issue comes to mind. We consider this as prohibited, yet a guy who jammed welfare traffic for hurricane Hugo is not touched. He stayed within the "letter" of the regs, yet violated the intent. We were in charleston from Atlanta helping with the

traffic handling. This guy uses his own callsign, was confirmed, yet nothing happens.

Anyway, those are my (rambling) thoughts. As I ftp a compressed binary over 56k to another ham. (NOS, no dirty words that I know of, except AX.25 :-> I think I will go wash my mouth out.)

73, quit arguing, and build something! (HW or SW, anything!)

If the problem is that the host can talk to the pk88 but the pk88 never talks back in KISS mode you may have been stung by the same thing that got me on my pk88s.

The bloody RTS line on the pk88 is a FLOATING input!!!

Tie pins 4 and 6 together on the pk88 end and try again.

Hardware flow control is forced on when KISS ON is issued, consequently this problem may only show up when trying to run KISS modes.

DESIGN OF A MULTI-TNC CONTROLLER

by:
Andre Bakkers PA0APA, Erwin Hoogzaad PE1CFJ, and Marcel Schwirtz
ETGD Club Station, University of Twente, PO box 217, NL-7500 AE Enschede
indebted to DG9FU, DB8AS and PA0HWB
email: elbscbks@utwente.nl

The june 1990 issue of QEX will contain our article describing a multiport-TNC controller. The following text contains some background information.

On October 5 1988, DG9FU and DB8AS launched the idea to use RTS/CTS control in a system using TNC's equipped with NetRom software, to prevent packet collision on the RS-232 channel. These collisions occur when one TNC is transmitting while another TNC wants to start transmitting packets.

PA0HWB has performed measurements on the RS-232 channel that indicate, at least in his system, that this channel exhibits an efficiency of 20%. With a baud rate of 9600 on the RS-232 channel this results in an effective baud rate through the node of 9600x0.20 = 1920 Baud. Division by the number of channels, in his case four, results in 480 Baud per TNC!

As soon as one TNC activates his RTS line (pin 5, active = low), usually two other TNC's start to transmit (Murphy's law). Possibly this may be improved in the NetRom software as well.

The idea of DG9FU and DB8AS consists of a proposal to enable the CTS (pin 4) inputs of the TNC's one by one with the use of a counter. The counter will be stopped as long as the TNC replies with an active low RTS signal (pin 5), within approximately 3 mSec.. As a result this enabled TNC is the only one that may start transmitting on the RS-232 channel. As soon as the packet has been transmitted, this TNC will deactivate its RTS line which in turn allows the counter to resume counting.

The DG9FU and DB8AS design, consisting of a 4017 counter and a NE555 clock oscillator, excels in simplicity, but suffers from the well known problems

of the diode matrix. Besides any TNC can halt the counter at any time by setting its RTS low. The TNC that is enabled by the counter will consequently be allowed to start transmitting. However, this need not be the same TNC that made its RTS low. As a result the system deadlocks.

In the Multi-TNC Controller, which operates completely at TTL level, the counter will continue to count in such a case until the correct TNC is enabled. Then the counter will stop and this TNC will be allowed to transmit its packet. Moreover the RxD signals are enabled with the CTS signals.

A maximum of 8 TNC's may be connected to the controller, not connected ports will not hamper the operation of the controller. TNC's may be connected or removed while the controller is in operation.

At the club station PI8THT of the University of Twente this idea has been converted into logic formulas and has resulted in an EPLD and a printed circuit board design. The logic expressions are available as EPLD design file on request. The EPLD type is EP900-PC2 or EP900-DC for the non-erasable or erasable type respectively. The printed circuit board layout is available as a plotter file or as a film at a nominal charge.

The Multi-TNC controller has a theoretical throughput equal to maximum of all channels, almost 1200xn where n is the number of channels. If the RS-232 baud rate is increased from the usual 9600 to 19200 Baud, the resulting delay of the network node becomes hardly noticeable. Furthermore all channels will be serviced evenly and one will not even be bothered by the delay of Mailbox traffic as long as the Mailboxes use the maximum value of PACLEN = 236 and a value of MAXFRAME = 1 as the setting for their TNC's. The TNC's will scanned by the adjustable clock which may be adjusted between 200 and 400 Hz.

The Multi-TNC controller has been in operation at three nodes in Holland for about 6 month, showing an improved network thoughput.

Oh boy! I read your QEX article and liked it, but I'm confused about
something. The idea seems to be servicing multiple TNC's by
multiplexing a single RS232 line. Why not just use separate lines?
Multiple UART chips are cheap enough and it doesn't seem any more
complex or expensive to make a multi-port RS232 board than to build a
board that implements daisy-chaining on an RS232 line.

It's obvious from the amount and quality of work that went into the
article that I'm missing something that makes this solution better.
Could you do an "idiot's summary" of why this method was chosen?

So what are you saying? Should code developers abandon a minimally adequate platform like the PC and retreat to a VIC-20 for their coding? You do understand that a clone PC is CHEAPER than a new C64 and disk drive don't you? You do understand that developing code for networking IS the hobby of the code developers don't you? Are you saying they should practice THEIR hobby only on machines that they KNOW are inadequate to the task?

There are certain minimum requirements to playing network packet radio.
You need a license.
You need a radio or a GRAPES RF modem.
You need a TNC or digital interface card.
You need the software supplied FREE by the code developers.
YOU NEED A PC.

The minimum requirements are less than and MUCH cheaper than those required for DXing, working satellites, or ATV. If you want to play, you gotta pay (at least a little).

I'm sorry, but I have little patience with people who aren't willing to meet the minimum requirements and who complain that the network won't work with their Halicrafters Sky Buddy and ENIAC.

[flame deleted]

You miss the point entirely:

The TCP/IP crowd as represented in this newsgroup seems to be rapidly becoming
a group whose credo could be: "Subscribe to exactly MY model of what amateur
radio should be, or go to hell." This attitude isn't new or restricted to
any one group - it's been a major part of ham radio for the entire 25 years I've
held my license and has been expressed by the homebrewers, the traffic fanatics,
the public service enthusiasts etc. etc. etc.

What I am advocating is NOT that the 'leading edge' developers ABANDON anything.
What I think needs to happen, however, is to recognize that not EVERY ham NEEDS
to have a 'well-connected' host that is up 24-hours/7-days. By EXPANDING the
vision and developing such things as a restricted telnet client that CAN run
on, say, a C-64 so that the interested ham can log in to a well-connected
server and read the news, send some mail, read some other mail, establish
a telnet link to someone else, etc.

What has the hobby got to lose be becoming more INCLUSIVE instead of more
EXCLUSIVE? Why is the only 'acceptable' newcomer a network engineer?
Couldn't the 'BBS' (or server in my parlance) become more like one of the
public access UNIX systems where conferencing, USENET, e-mail and the like
are available to anyone with a terminal and a modem and do it based on
IP rather than 'vanilla' AX.25? That way, the interested but restricted
(by funds/expertise/time) amateur could take part in the IP-based future
rather than be forced to remain in the X.25 past.

Why should amateur radio, which historically has been an innovator, be
stuck FOLLOWING technology instead of LEADING it? Client/server architectures
are becoming extremely common throughout industry. In fact, it is trivial
to put together a system (on an Ethernet) consisting of a primary server
that HAS NO TERMINAL/SCREEN AT ALL and 'terminal servers' (NOS-in-a-box) that
either happily connect dumb terminals to the server via telnet, or gateway
SLIP connections if the attached devices has any brains at all. Why can't
amatuer packet be as accomodating?

I don't think that anybody is saying this ... at least, we can easily
dismiss the people who ARE saying it as (ahem) idiots, and drop the
conversation. The bigger problem is that you have the "status quo,
it works why change it" group vs. the techies.

We could certainly coexist, except that I as a techie feel seriously
out-numbered. I also realize that price is closely related to the

size of the user base (supply and demand, etc) and so it is to my benifit to show others the wonders of it all.

The point of me starting this heated discussion is not to argue about who should be using what box. It's that the C-64 users are telling many newcomers, "Yes, a C-64 or VIC-20 or other notsopocketcalculator will work just as well as a PC". NO. It will NOT work just as well. The newcomers are NOT being given the whole story; they are being told that a $80 solution is just as good as a PC. Who would rather pay $600 for something that somebody just told you an be done for $80?

Well...OK, that's not the whole story...but it's part of it which I would like to see picked up on here.

>YOU NEED A PC.

Wellllllllllllll...I was hoping that by this time (Summer 1990) that wouldn't be true. The Data Engine turned out to not be what I had expected, though, and I see it as a neat toy but not particularly useful to most people. From the marketing/promotional standpoint (and for the good of ham radio), I would have prefered to see the next generation of TNC2 come out; something on the order of an 8086-based TNC-2 with more memory. This wouldn't have driven the price up very much (8086's and 8088's are cheap; even better, NEC V-20!!!) and memory is not THAT unreasonable. This would have several BIG advantages:

- be able to develop software in a native environment, rather than using cross-development tools.

- make it perfectly reasonable to implement higher-level protocols with very little work, e.g. how about a partial nos-in-a-box that Joe User can use with a dumb terminal ?

- Give us some long-haul networking capabilities with a good, cheap box that you can bolt on to a tower in the middle of nowhere and FORGET ABOUT IT.

Comments?

Bill,

I've made almost the same arguments before but I think you've missed the point.
Yes, there are a bunch of very opinioniated people writing network code and
yes, some of their opinions are plain BS. HOWEVER, they ARE the ones
writing the code and that means that they get to do it however they like.
My major gripes have been that a) the implementors have been building to
an idealized model of amateur networking that does not work out in the
field and b) they don't communicate very well with the rest of us. (That
criticism is now muted somewhat with Phil's release of a draft manual)
Other complaints include many developers going their own way and doing little
to assist in keeping all the code synchronized. But the fact remains, there
IS networking code available in source form for anyone else to work with.

>What I think needs to happen, however, is to recognize that not EVERY ham NEEDS
>to have a 'well-connected' host that is up 24-hours/7-days. By EXPANDING the

First off, no one who is knowledgable enough to work with IP code is going
to babysit C-64 users. Not to mention the misery a porting effort would
involve. Like Gary said, if you wanna play, at least you gotta buy a ball.
Considering that I can buy several well equipped XT-class machines for the
cost of a modern HF rig, I can't shed too many crocodile tears for those
who cry poorhouse. Once they get the basic equipment, then we can help them.

I start having problems with the current situation when it is claimed that

people must invest in the latest and greatest expensive and unreliable gadget of the day in order to be REAL packet hams. Someone who has a PC, a radio, a TNC and an antenna should be able to participate at some level. Maybe not much but at least a bit. And I predict the time will come when not too many even casual users will want to work with less than 9600 baud.

The key here is services. Quite frankly, currently I cannot see much to keep an average ham's interest in packet once the new wears off. Services now are limited to BBS operation. What is needed is for some of the people who complain about the plight of the average ham (and who are quite capable of doing the deed) to start writing code instead of more whining. How about a network chat system, a call sign database server, a contest/DX server, voice mail, store and forward mail, news and the like? The platform is available in the form of TCP/IP that pretty much works now and has a fairly well defined API. When I speak of servers, I also include the clients to run on the pc, not just something to be telneted into.

To summarize, I don't give a damn about your typical old whiny ham who wants to do no more than keyboard chat while refusing to support the work of others with neither time nor money. If they don't show any more interest than that, quite frankly, let them go back to 75 meters.

On the other hand, I do believe that modern networking technology should be available to the ham of average technical ability with a minimum of pain. No, it will never become a turnkey situation where someone can pride themselves in their ignorance and still use the technology effectivly. We can however, put together a system whereby a ham can plug a few components in, configure a few things, and be on the air. I'd like to think that this task would involve plugging in an interface board that connects to a turnkey WA4DSY/GRAPES RF modem at 56k :-)

So perhaps the next time someone complains about the elitists on packet, perhaps you could shove a disk containing NOS sources under their noses and suggest maybe they take the several man-years of work involved and build something useful on top of it.

John

If that's the impression given by the postings here, it is a false one.
I can say with some certainty that the major players in the TCP/IP
development effort have _no_ intention of fostering an elitist ham radio.
Is there technological chauvinism within that group of people? Probably
a little. But I think the record shows that the TCP/IP software is
getting closer to the kind of thing you espouse. The current NOS system
includes "vanilla" AX.25 and NET/ROM access to the system, allowing any
user of an off-the-shelf TNC to access the NOS station, at which point
he/she can "bridge" to TELNET, thus accessing services of the TCP/IP
network. Given that, is a VIC-20 TELNET implementation critically needed?

It's getting there. Have a little patience and you will see it happen.

In the meantime, let's let the developers work on the part of the problem
that most interests them. Understand that NOS is a work in progress, as
is the development of an amateur digital network. I agree that the
average user (whoever that is :-) needs to be brought on board, but it's
too early for that just yet.

The only complaint I have with you, Bill, is that you seem to be saying
that because some talented people have developed something worthwhile
on their PCs/Macs/Amigas they are somehow _obligated_ to make it
available for the VIC-20/C-64/Timex 1000. I don't see it, myself.
The fact that these people are not personally interested in spending
their time developing C-64 code is not a black mark against them.
Frankly, I'd rather they spend their time advancing the state of the
art than dragging each ham up by his/her bootstraps to the present state
of the art.

Jon

I DON'T WANT NOS IN A C-64! (I don't even own one!)

It seems that a lack of a smiley after the VIC-20 comment means that nobody caught that it was a wry/sarcastic remark!

What I DO think is necessary, as other posters have implied, is that there be some sort of GATEWAY such that those who are STUCK with the (fill in your favorite bitty box) can make USE of the more sophisticated features provided by NOS/NET while the sophisticated stuff is running on some far more powerful server.

Think of KISS turned upside down - a client node runs a SIMPLE protocol that allows it to connect with the server and maintain multiple connections (Please not AX.25!). The server takes the commands/data from the client node and processes them, wrapping the appropriate IP headers around them if necessary and forwarding them on via the well-connected IP network. Returned stuff gets unwrapped and returned to the client node using the SIMPLE protocol.

A bit of malice aforethought could result in a fairly efficient point-to-point service that WOULD fit in a bitty box - after all, it doesn't NEED to worry about more than ONE route/connection!

Is my point a little clearer? Do you catch my contention that it is NOT necessary for ALL hams to run a FULL implementation of NET/NOS in order to USE them?

After all, I'm writing this on a PC attached to a (large) UNIX box. By comparison, the PC is a bitty box. But who cares? By terminal connect I am able to make full use of the capabilities of my UNIX system without having to run full UNIX on my PC.

Let me rephrase my proposal like this: Let's develop software for USER INTERFACES that will run happily on bitty boxes and can connect cleanly and efficiently with ONE server (at a time). Let the server be whatever the server provider (individual or club) can afford and let it run the most sophisticated NOS Phil and the rest can possibly develop. By doing such, by allowing USERS to get by with simple equipment, we can reach out to include a far greater number of hams in the digital network of the future.

If this doesn't clarify it, then let's drop it now. No sense wasting net bandwidth with flame wars.

They are trying to solve a very specific problem, which is the interconnection
of multiple NET/ROM or compatible TNC-2's together in the way that the NET/ROM
firmware expects them to be connected to implement a multi-port switch. The
solution they've chosen is a pretty good shot at that. I don't exactly want
one, but then I don't exactly want a multi-port TNC-2 anything...

Have you looked at using POP and NNTP? I rember seeing a reference about
someone doing somethig with pop (probably in May or sooner while I was
still at school).

>
>Hmm. This sounds suspiciously like the much-maligned BBS!

>Perhaps the amateur community could be UNITED, rather than split, around
>TCP/IP if some work were done to develop appropriate server software that
>runs on top of the TCP/IP package so that workstations/leaf-sites could
>come and go as appropriate to the USERS' needs without mucking up mail
>and file transfers.

Using POP and a mail server would take care of the mail and news transfer
items... The model for using pop that I would propose is have a client
login and download the mailbox to the local system, which then adds it
to the local user's mailbox for later processing.

Two points on this model:
1) The hardware required for such a server is not the same as that suited
to hill-top environments, much like the reason for bbs's are not on the
hills. I propose two systems: the hilltop IP switch and a server 'close'
to it, but readily accessable to the sysop.

2) I am reasonably certian that not all of the software is written (yet).

After theese, the next (and mabye hardest administratively) would be
maintaining the routing tables, especially in the network switches...

> ... not workaholics or lack the technical
>expertise to develop an IP-compliant cilent that runs on a VIC-20.

Except for the network look, the function would be not much more than
that available via ax25 connects to the station. I think the point that
several are trying to make is that fitting TCP/IP into a C64 or VIC-20
or (fill in your favorite hardware here) is not a trivial task. However,
if you want to take Phil's code, and chop out all but the IP and telnet
portions then port that, go ahead (mabye also leave the DNS client?
for routing, one default with redirects should be ok with a IP hub,
but I digress).

Once you (or whoever) writes the 'generic' low-thruput telnet-only
code (or extracts it from Phil's), it might be a better base for porting
to other 'dumb' systems. Phil is fighting bloating, but he is also trying to
provide a broad, useful generic base that will also be useable with
many varients of PC (and other for the generic stuff) hardware.

My intrests, once I get my license (I am learning the secret code
right now :-), include (in order of feasable attack, not necessarly intrest):

    POP and NNTP clients/servers, allowing users to 'go away' and still
    participate in TCP/IP networks

    New partitions of the network layers, to support intellegent hardware
    and reduce host load for higher speed networks and/or background operation

    New routing protocols and multicast protocols (eg VMTP) that better
    fit the amateur packet Real-World(TM) model

    General applications that will use and require the higher speed networks
    (and getting these into operation)

milton

PS: How did I get interested, you ask? well, as far as TCP/IP goes, it
comes from reading RFC's and kernels and...
For Amateur radio, it is from my roomate at school.

PPS: I am doing this at 300 baud, so please bear with any typo's I missed.

I have not been able to find much useful information on TNC-2's.
At least, not information which is on the level I seek.

I would like to confirm some of the following information, as well as
ask some questions:

1. It appears that the I/O mapping in a TNC-2 is as follows:

          PORT 0 - HDLC data register
          PORT 1 - HDLC control register

          PORT 2 - UART data register
          PORT 3 - UART control register

    If this is the case, I should be able to use the usual IN and
OUT instructions on the above numbers to get to them. Can anybody confirm
this?

2. Is TRANSMIT (both HDLC and SIO) polled, or interrupt driven?
From the HDLC side, how do I tell the modem to key up and key down,
is this embedded in the HDLC control register?

This is for starters; as I learn, more will probably follow. I should
mention that I'm working strictly in assembly, to save space (I view
32K of assembly object as a challenge :-))

Chris

I'm trying to send data over a terrestrial telephone mobile radio
network based on 460 Mhz carriers. I want to use the installed
radio equipment.

My first idea was to use CCITT (or BELL) analog voiceband modems.
I think the four wire standards may work well.

I think TNC's are a better solution, but I'm not familiar with
ham radio packets.

So I'm looking for pointers to information on how TNC works
and who sells them.

Thank you in advance,

Antonio

I think you missed MY point entirely. I was not saying that everyone
should have to be a network engineer or that a BBS type service should
go away. What I was saying was that the VIC-20/C64/terminal is not IMHO
an adequate platform for ANY type of IP based service. And further, the
code developers have the tools to develop code for the PC, the PC is
extremely price competitive with a C64+disk, and none of the current
HOBBY developers have ANY interest in attempting a client on an eight
bit machine anymore. This does not mean that YOU are not welcome to
develop such a client. All the C source is freely available.

Many of us recognize that not every ham is willing to have a 24hr a
day IP host at his station. This is why work is proceeding on POP,
the post office protocol. Also, some of us allow telnet login on
our Unix(tm) boxes. Bdale's Nos-in-a-box is mainly aimed at switch
service (no disk) but could be used to allow a plain terminal/TNC
user to connect and do a telnet session.

The major problems that we have with link level only AX25 users are
the inadequate channel management in the TNC firmware, and the
attitude that ALL I NEED IS A TNC AND A TERMINAL TO DO PACKET and
why don't YOU write software to let me do all the neat things you
keep talking about. If I were in the BUSINESS of selling networking
products, this MIGHT be a legitimate attitude, BUT THIS IS A HOBBY.

>The TCP/IP crowd as represented in this newsgroup seems to be rapidly becoming
>a group whose credo could be: "Subscribe to exactly MY model of what amateur
>radio should be, or go to hell."

Ok, fair enough. That is, in my opinion, a serious misrepresentation of what most of the "TCP/IP crowd" is really like, but I'm more than willing to admit that we may have come to appear that way in this forum... ouch.

>By EXPANDING the
>vision and developing such things as a restricted telnet client that CAN run
>on, say, a C-64 so that the interested ham can log in to a well-connected
>server and read the news, send some mail, read some other mail, establish
>a telnet link to someone else, etc.

The effect that you are asking for is actually happening, with the NOSINABOX code that N4PCR and I are working on for the Grace PackeTen card, the Kantronics DE, and the AEA PS-186. We use a slightly different model, to avoid having to find pneumatic shoehorns and the time to apply them to each of the many "small home computers" like the C64. We put code in the local packet switch for a community that allows AX.25 users to connect to the switch (many at a time, even), and get access to a set of services from there. In effect, you're plugging your C64 with AX.25 "terminal" into a "terminal server" that speaks IP, etc... Not absolutely sure, but I think this solves the problem you're identifying, *without* requiring us to write any code for things like C64's...

>What has the hobby got to lose be becoming more INCLUSIVE instead of more
>EXCLUSIVE?

I wish I knew...

>Why is the only 'acceptable' newcomer a network engineer?

This is not my perception at all. The problem that started this current round of discussion might be paraphrased "why can't I put a big-block V8 in my Honda Civic?". Noone that I've seen has tried to suggest that Honda's should be banned from the roads, but many folks have suggested more or less successfully that you need something bigger than a Honda to wedge in a big engine...

Pardon my frequent slip into analogy, but from the mail I've gotten in the last couple of days, it seems to be helping some folks understand the difference between "C64 bashing" and "realizing that some tasks require more horsepower than a C64 provides".

>Couldn't the 'BBS' (or server in my parlance) become more like one of the
>public access UNIX systems where conferencing, USENET, e-mail and the like
>are available to anyone with a terminal and a modem and do it based on
>IP rather than 'vanilla' AX.25? That way, the interested but restricted
>(by funds/expertise/time) amateur could take part in the IP-based future

>rather than be forced to remain in the X.25 past.

I certainly hope so! Around here, it's almost working now... we're providing a whole set of services on a Unix machine running IP, and anyone with NET or NOS can get access to those services with Telnet, FTP, NNTP, etc... the next step is to bring a switch or two online with the terminal server code, then this same set of services will be available to anyone with AX.25 capability... albeit slowly.

>Why should amateur radio, which historically has been an innovator, be
>stuck FOLLOWING technology instead of LEADING it?

Probably the same reason our country now follows technology more than leading it in any of a number of areas... a poor education system, negative financial motivation to excell, etc... but let's leave that one for a hot night and a cold beer...

>Why can't amatuer packet be as accomodating?

I think it can. It just requires more folks actually working on making it happen, and less people "following", asking the doers why it hasn't happened yet...

    Some days (weeks?) ago, i saw a list of people responsible for
    the assignment of network-numbers in their countries.
    I lost this list, so would someone be so kind to e-mail
    this list to me?
    I need the name (and network address) for the guy in W.Germany.

    regards
    /jr

Hello there,

I am looking for a land line BBS that I can download the KA9Q package for the
Atari ST.

I already tried Delphi and Compuserve, but it is not there.

Thanks,

Javier Henderson | henderson@hamavnet.com | These opinions

I fail to see what the big stink over C64's running TCP is. I think it could be done. I bought one when the suckers cost $550.00. I put it in the closet about 3 years ago. Now I program Cybers, Sperry 1100's Suns, Apollos, you name it. It would be tough to have multilple session telnets, ftp's and a bbs, but it is time someone wrote at least a client for it. (Not me - I am too busy writing PC code for NOS). The point is, I bet alot of people would like to do it, but would feel stupid about it. Frankly, if someone comes up with a telnet or ftp client, Ill pull mine out of the closet. Be sure to make it compatible with Digicomm.

By the way - a real telnet server, one that puts you at the C64 command prompt would be a hell of a lot easier to do than putting that on a pc. It might make us PC programmers blush.....

Standard SLIP requires no handshaking lines at all; just three wires will do

(gnd, tx data, rx data). The recent version of NOS includes a contribution that supports optional RTS/CTS handshaking; that's what the mention of "CTS ints" in the asy stat command refers to. Check the docs and the source for the details of how this operates; I haven't actually used this feature myself.

The Title pretty well sums it up. Now that everyone is looking for the DE and other faster systems, does anyone have any TNC-1's they want to get rid of (hopefully cheap)?? I have something I would like to try but it requires a TNC-1 (6800) and because it is all experimental anyway, I would just as soon not have to mortgage the farm to try it out.
So anybody out there who has a couple of these beasties collecting dust that wants to unload them, I'm interested.

Thanks in advance for any help.

For some reason, the version of asy_output() in 8250.c in NOS 900612
has the kick start code commented out. I probably did it in order to
test something, and then forgot to re-enable it before sending out
the distribution. If you're having transmitter constipation troubles,
all you have to do is to uncomment the two lines at the end of
that function and remake net.exe. Sorry for the trouble.

Here is one technically oriented person who would love to be doing
packet radio but who doesn't have time/interest in learning code.

I don't see why code is *necessary* anymore. I can see an argument
that in an emergency situation that if you were having to cobble
a radio out of spare parts it might be easier to build one for code
than one for voice. But, as I'm remembering the circuitry, adding
voice to a radio is simply

     microphone -> amplifier
and
     amplifier -> speaker

Both of which are available in plentiful supply. How many people
have old cassette tape recorders sitting around? I know I do..

The argument that it's a hurdle to keep out the dweebs is interesting.
But since it keeps me out too.. I don't like it. :-)

Has anyone else tried to compile the NOS code with the new Turbo C++?
If you have and somehow got a useable exe file let me know, because
I haven't been able to yet.

C++ has much more type checking and it will not compile at least 60%
of the code. I have the 4/xx/90 version and after about 5 hours of
rearranging include statements so that it would compile without
fatal errors the exe that was built wouldn't work. There were always
a great number of warnings with TC2.0, but no fatal errors and the
exe ran. With C++ the number of warnings goes way up and about
6 out of 10 files contains a fatal error. Most are due to include files
in the wrong order. I don't know how it passed TC2.

Our users already have login access to three Unix boxes here in Atlanta.
But it isn't very practical to be a remote user of a Unix system when
your net thruput is ~150 baud. With one of our 56k links it is pleasant
to login and use your Unix account, but to run 56k right now you need
a PC equivalent and NOS to keep up with the digital bits. So even with
the big powerful server you need a PC level bitty box AND a fast RF modem.

You don't know what pain and frustration are until you try to use a
simplex 1200 baud packet channel in a busy metropolitan area for
interactive work. With 150 active users, mostly hidden terminals, and
two BBS systems, you are lucky to get 80 characters a MINUTE net thruput.

The reality is that on a contention channel with modest TNC level baudrates,
you don't want to do much interactive work with a big server. What you
need to do is start a client process such as ftp or smtp on your local
box and let it patiently deal with the slow channel and alert you when
it's done. THIS IS WHAT NOS DOES! AND you aren't limited to interacting
with a few big servers. You have file transfer access and mail delivery

service directly to ALL those other bitty boxes out there.

NOS is not rocket science, we have retired PR types who don't know a bit from a byte who happily run NOS as USERS. Sure, at the present state of development of the package, it takes a little coaching from an experienced user to get them started, but it isn't HARD to use.

To sum up, I think your mental MODEL of packet radio is wrong. With slow channels likely to be with us for the forseeable future, at least for casual users, the idea of INTERACTIVE packet is unworkable. NOS gives us the option of requesting a service from a remote machine by making a request on our local machine, then going away and doing something else until our requested service is completed. Sure, there is plenty of work left to be done on the package, but it is usable right now.

Gary KE4ZV

>"stupid cat" is unnecessarily redundant
MINI-FLAME
Cats are smarter than people. They get us to feed them and clean their litter boxes don't they? You've never seen a cat work eight hours a day to feed his person have you? :-)

>BIG advantages:

That's what a DE *is*, at least to me... a faster TNC with a V40 engine, which is just a V20 with onboard stuff like DMA and serial ports and interrupt

controllers, which you'd want anyway. What were you expecting, and have you looked at a DE up close and personal?

>   - be able to develop software in a native environment,
>   rather than using cross-development tools.

For the DE, I'm using Turbo C 2.0 on an AT clone, and a toolset from Paradigm that allows easy .EXE and .MAP -> ROM image. Others have been downloading code over the serial port using a debug monitor thingy on the DE and PS-186. It's really pretty easy.

>   - make it perfectly reasonable to implement higher-level
>   protocols with very little work, e.g. how about a
>   partial nos-in-a-box that Joe User can use with
>   a dumb terminal ?

That's one of the things you'll get when my code is done. I'm not sure why anyone would buy one for that, when for the price of a DE they can have most of a 640k XT clone with floppy, which is a better base for the future, but...

>Comments?

I always have some... :-)

>in order to off-load the processor.

I contend that if you're talking about a PC/XT/AT at all, you ought to be

talking about an intelligent plug-in card... or at least a dumb plug-in card.

To me, at least, the niche that exists unfilled is for a standalone product that is targetted to work with all the non-PC machines out there. The Macs, Amigas, Atari ST's, workstations, etc. For all that stuff, the right answer is SCSI, and even if you have to pull out a logic analyzer and reverse engineer the cable, it still isn't that hard.

>Once we begin to talk more than about a hundred bux or so, we really need
>to look at ethernet adaptors. Remember what the original objective of the
>discussion was - to provide something cheap capable of being use by Joe
>EveryHam at moderate speeds.

Then for a PC it ought to be a plug-in card. There's no cheaper way to do it. You get to steal power and cabinetry from the PC. You don't have the interface problem, etc...

>Perhaps the thing to do is to build a protocol converter that has
>a thinnet port on one side and a sync port on the other.

This would work great for some of us, but I think would miss the point for a lot of other folks... they don't have thinnet either...

>provided by NOS/NET while the sophisticated stuff is running on some
>far more powerful server.

It exists today. Run a copy of NOS on a PC somewhere in your area, and turn on the "AX.25 Mailbox" functionality. Other folks can AX.25 connect to the machine and have access to a fairly rich subset of the available functionality.

We're going to make it even easier with NOSINABOX.

>Let me rephrase my proposal like this: Let's develop software for
>USER INTERFACES that will run happily on bitty boxes and can connect
>cleanly and efficiently with ONE server (at a time).

There's nothing to develop. Unless you have an especially rabid opinion of AX.25 (most of us don't), you might as well use it as the user connection mechanism because it exists, and you don't have to write any code to use it, and all the TNC toting hams of the world will still be unhappy if you don't use it. Right?

>"stupid cat" is unnecessarily redundant

I ought to resent that... but I'll leave it alone... I *like* my cats, and they are far from stupid! :-)

I believe that the real problem is that most folks who would be willing and able to do this are in fact off writing code for something else now... but I too would love to see someone take and do this... it would certainly squelch an amazing amount of noise on the subject...

Dig up a copy of the KA9Q distribution, and unpack the TNC_TNC2.ARC archive.
It contains, among other things, the full source to a rev of K3MC's KISS for
the TNC2. It's written in assembler, and has all the info you need embedded
in the comments and defines.

If you can't find it, email me and I'll send you the source.

After talking to Karl, WK5M, from Kantronics, I was told the KISS Protocol
standard could be found in:

6th Computer Networking Conference
KISS Protocol Standard
Redondo Beach, CA

PP. 38-43

As I understand it, ARRL should still have a copy of this. However, does
anyone on the net happen to have an electronic version or a paper copy
that could be easily scanned?

Sigh. This is probably a Good Thing for introducing AX.25 users to the
extended features available through TCP/IP, but it doesn't exactly help
the channel-access situation for those of us trying to use TCP on the
channel at the same time.

Yesterday I hooked up my packet station for the first time in months to
hand out some Field Day contacts. I wandered over to the TCP channel,
saw a couple of new users, and decided to look them up in the N6OYU
callsign server. So I initiated a finger command to Doug's machine, and

very quickly realized that I was getting blown out of the water by someone on channel who had an AX.25 connection going to an AX.25/TCP mailbox. TCP being as gracious as it is, and AX.25 being so aggressive, the interval between successive packets coming to me kept getting longer and longer and...until I finally reset the socket and went back to FD stuff.

I don't know what the moral of this story is. Maybe that (as is true with Mike Chepponis' system) the AX.25 half of the mailbox should be on another frequency. I like the idea of giving AX.25 users a peek at TCP/IP. I don't care for the idea of our assigned channel getting filled up with AX.25 packets.

I have a friend that is looking for information on connecting an Azden m3000 to a PK232 for packet. While I'm sure that with enough muddling, we could get it to sing, there are two reasons for asking the net before warming up the iron...(pencil?)

1) The radio is not mine...
2) He had heard that some Azden radios were particularly sensitive to misapplication of PTT/MIC signals (not much buffering between PTT in, and uP goes the story).

Can someone help us out, or point me to the correct CQ mag issue if you happen to have performed this operation?

>any one group - it's been a major part of ham radio for the entire 25 years I've
>held my license and has been expressed by the homebrewers, the traffic fanatics,
>the public service enthusiasts etc. etc. etc.>

We're a very homogenous aggregation of quite singular interest groups.

Why do some carp about perceived deficiencies, but aren't willing
to WRITE the ferschluginner software for their obsolete machines?

If you like running AM on a 6V6 pierce oscillator on 75 meters,
that's very well and good. But don't expect me to design and build
that antique for you.

I have an Olivetti M-10 (TRS100 clone), with 32K RAM and NO drive; this
is an obsolete machine. I wanted to run a small forwarding w0rli-compat
PBBS on it, so I learned microsoft basic, took a copy of Dick N1AED's
miniPBBS for the TRS100, picked many brains for w0rli forwarding information,
and modified the progam. Yes, it took a lot of time, but I wanted it bad
enough to shut up and do something about it!

Please realize that the insistence on state of the art on obsolete machines is holding back the development of amateur radio. We're about 15 years retarded.

CASE IN POINT: DIGICOM

Have you ever seen DIGICOM? It's a truly marvelous package for the C-64, which software emulates a TNC, terminal, conference bridge, file server, etc. All you need is DIGICOM software, a C-64, and a modem board for a truly state of the art ax.25 packet machine.

And _that's_ exactly my point!!! State of the art packet runs on a machine that's been dead meat on ice for 10 years!!!

How will we ever get 9600 baud networks, 56 kB, T-1, etc., when packet state of the art runs on a machine that limps at 1200 baud? C'mon, guys. Grow up! Put your little playtoys in the attic where they belong! Or at least don't come crying because your TRS80 model 1 with 4K and level 1 basic won't run /ip.

>   ....By EXPANDING the
>vision and developing such things as a restricted telnet client that CAN run
>on, say, a C-64 so that the interested ham can log in to a well-connected
>server and read the news, send some mail, read some other mail, establish
>a telnet link to someone else, etc.

Delete "telnet", tie in some PBBS's to USENET feeds, and you have ax.25 packet.

What if we insisted that Model T's be accommodated in the Indy 500?

>What has the hobby got to lose be becoming more INCLUSIVE instead of more
>EXCLUSIVE? Why is the only 'acceptable' newcomer a network engineer?

Owning a $300 XT-compat makes one a network engineer? Eureka!

If you want to play hardball baseball, you need a glove and bat.
With only 64K RAM and a wimpy operating system, the kiddie computers would of necessity be much more complicated to use for something as demanding of speed and memory as /ip.
>
>Why should amateur radio, which historically has been an innovator, be
>stuck FOLLOWING technology instead of LEADING it?

Because everyone wants to use technology of 15 years ago. How can we lead when state of the art in ham radio is Z-80 and C-64?

>...either happily connect dumb terminals to the server via telnet, or gateway
>SLIP connections if the attached devices has any brains at all. Why can't
>amatuer packet be as accomodating?

But it IS - all you need is a dumb terminal and TNC, and plug in your radio, then beg for help, because ax.25 1200 baud AFSK packet is a very

poor, difficult way to do things! That's what you get when you settle
for inferior equipment because it interfaces with the cheap, existing,
and convenient junk laying aroud the shack.

Whatever happened to our tradition of building, fixing, and modifying?
I suppose it's gone the way of the dodo, and the work ethic........
Everyone wants something for nothing, right now.

Ooops... sorry Patty, I would *never* suggest operating IP and raw AX.25 on
the same channel when you have a choice in the matter. I have discovered,
however, that with judicious selection of slottime (longer than dwait used by
the AX.25 guys), and P (on the order of 1/8 or less), that you can coexist
fairly well with AX.25 (ab)users.

>I don't know what the moral of this story is. Maybe that (as is true with

I understand. It's got to be a local issue. The point I really wanted to make
was that you could put a PC at a multi-port switch site *today* and get the
desired functionality, regardless of what services you assign to what channels.
NOSINABOX will be at first nothing more than an EPROM'ed rendition of this for
some hardware a little more directly suited to the environment in question...

  As long as the debate is going I may as well throw in my 2 cents worth on the suitability of SCSI as an interface for NET.
I'm running NET on a Mac+ and other then the serial port which runs at a maximum of 57.6k baud, the ONLY other interface port I have is a SCSI port. It sure would be nice to use it for a network connection..
Furthermore, Don Lemley of Grace communications (Packet Ten fame) is *rumored* to be considering a SCSI interface for his Really Awesome I/O board.
I understand that IBM now officially endorses SCSI as an interface standard for IBM pc's. Undoubtedly due to the popularity of SCSI for interfacing CD-ROM players to thier equipment.
Phil's philosophy has been "to use standards where standards exist" lets not get TOO excited about about using a MOSTLY bi-directional printer port for networking when a ubiquitous standard already exists!

What does buying a Taiwanese XT clone and downloading Phil's gift wrapped
software have to do with building, fixing, and modifying? That is just as
much appliance operating as an Icom, a microphone, and a triband beam.

The holy wars have moved to packet so soon? The only place with any peace is
CW, abuse in morse is such hard work.

Hi guys, it is nice to be back. It was hot and humid in Mississippi (as I expected), and it is nice to be back to the dry heat of LA :-)

Also, I see that I started a little flurry of mail about SCSI vs. parallel ports as high-speed TNC ports. I'd like to respond to a few general points.

1. Several submitters nattered on about "my XT clone this" and "my XT clone that". Get a grip. My original submissions clearly pointed out that I am not worried about the lowest cost XT/AT solution. Go by a plug-in card like the Eagle or DRSI or Paccom.

2. Other submitters said "Why worry about those workstations, anyway? No one uses them.". Well, shucks, tell that to Sun and Atari and Commodore. Once again, GET A GRIP.

3. The use of the XT parallel port as a bi-dir port is a non-issue as far as I'm concerned, see #1 above (you can buy a plug-in card).

4. This is not an either-or situation. In fact, I plan to test the SDLC/CPU part using the bi-dir PS/2 port before I ever use SCSI. So, stop the "I want this vs. I want that" crap. What a bunch of complainers. A PS/2 only version would address the 3 million MCA (Micro-Channel Arch) machines out there without requiring the construction of a new MCA board (a project in itself with the POS, etc.), and the parallel i/f would be quite simple.

Summary of above points: Lighten up, GET A GRIP, cool your jets, man. If the SCSI idea doesn't apply to you, then don't natter on.

5. A couple of submitters questioned the feasibility of actually using a SCSI i/f. These guys are informed and experienced, from what I can tell. The concerns are valid. I've been considering the Adaptec Nodem as a model of a SCSI communications device. These things are Ethernet to] SCSI adaptors, and they appear to work. I'm running with the assumption the idea is feasible.

6. I plan to use a purpose built SCSI i/f chip, which integrates the drivers, etc. required. This may change... I'm always open to good input (but I hate nattering and complaining without solutions).

7. My personal SCSI experience is limited to the IBM adaptors (MCA bus masters) and the AIX-PS/2 driver. The driver was written and supplied from inside IBM, but I spent much time in contact with the author of the driver. I regard his expert input quite highly and he has been quite helpful on details of a SCSI attached communications device (he has interfaced the Adaptec Nodem, for instance).

8. This is clearly a case of where I've decided a needs exists and plan to fill it by learning what I must to build the SCSI i/f.

So! I want to start building the prototypes this weekend. I do,

however need to get the Adaptec and Emulex data books for the SCSI
chips. If anyone has actual experience designing with these parts,
I'd like to hear about them (no nattering about "my Maxtor drive has the
Emulex part and it only seeks at 28 mS").

  Thanks to the folks offering constructive input. I hope the moaners,
complainers and pickers will GET A DAMN GRIP and wait until they have
something useful to offer before shooting off flaming know-it-all
messages. Afterall, I'm spending my own time and my own money on this.

73s

I'm planning to build a SCSI card for my computer, and since everyone is
talking SCSI, perhaps someone would enlight me on selecting the right
SCSI chip to use. I have Fujitsu MB87030, National Semi 5380 and
8490 spec sheets but I wonder which to use. I know that the 8490 and MB87030
can handle to up 4Mbytes/sec transfer, but which chip is easier to program
and which is easier to interface to differential SCSI bus.

John

dana@cygnus.la.locus.com (Dana H. Myers) writes:

Gee, Dana, I thought when you posted your original query, you were interested in gaining the benefit of those of us with some experience in the subject matter. I did not realize you had alread made your mind up or I would not have wasted my time "complaining". I'd invite you to "get a grip." Let's look at a couple of items.

>1. Several submitters nattered on about "my XT clone this" and "my
>   XT clone that". Get a grip. My original submissions clearly pointed
>   out that I am not worried about the lowest cost XT/AT solution. Go

>   No one uses them.". Well, shucks, tell that to Sun and Atari and
>   Commodore. Once again, GET A GRIP.

First, let's establish that 56k technology is at best, medium speed networking. It is certainly not "high speed" except in the context of 1200 bps Bell 202 operation.

The reason you got the responses relative to PC architecture machinery is that PCs are the overwhelming choice for amateur packet. Yes, there are 5 or 6 workstations out there (Atari? Really? :-) but for medium speed networking, the PC is the obvious choice.

If we're talking about those machismo, testesterone-loaded, manly workstations some of us get to play with at work or school, then my question is, why bother? (I'll be posting some benchmark data to comp.unix.i386 in a few days that may help redefine "workstations" :-) Every unix box I've had the opportunity to work with either comes with or can be configured for a bisync port. These ports, usually implemented as intelligent peripherals, are more than capable of 56kb. A driver and pump code to assemble ax.25 packets should be trivial to construct - at least trivial in the same context as writing an SCSI driver and making it co-exist with other SCSI devices. So why not just write the driver and provide cabling

information to connect the modem directly to the bisync port? I'll bet
GRAPES would even distribute this information with the kits.

>3. The use of the XT parallel port as a bi-dir port is a non-issue as
>   far as I'm concerned, see #1 above (you can buy a plug-in card).

Of course, the eager ham who has just completed his modem kit and wants
to get on the air can bop down to the friendly local Klone dealer,
burn a $20 and be ready to plug'n'play. Not quite so friendly
with the other cards.

>7. My personal SCSI experience is limited to the IBM adaptors (MCA
>   bus masters) and the AIX-PS/2 driver. The driver was written and

As I rear up out of the smelly slime generated by the PS/2-AIX sewer in order
to gain a breath of fresh air, my only comment is that whatever experience
you gain with SCSI on a MicroFunnel bus should be considered an anomoly.
Sorry to be so graphic but my wounds are still very fresh and are being
gouged anew even as we speak.

>8. This is clearly a case of where I've decided a needs exists and plan
>   to fill it by learning what I must to build the SCSI i/f.

Why did you not say so in the first place? If you desire to learn
something about SCSI interfacing and want to use Packet as the
vehicle, then by all means, go for it! You have my 100% support.
But you asked if such a device would be generally useful. Not in
a particular instance but as a general solution. Several of us
answered "no" and explained why in explicit detail. If you want to
ignore that advice, fine. In the end, it was worth no more than you
paid for it. But I think that the "grip getting" needs to be done
in your direction.

I'm now going to make another suggestion. Why don't you add the tiny
bit of additional logic necessary to permit the input interface to
be pluggable. You (or someone else, for that matter) could then
build BOTH interfaces plus maybe some others you have not yet
considered.

John

A number of the papers from the Sixth ARRL Computer Networking Conference
are available with anonymous FTP to louie.udel.edu in the directory
pub/arrl_papers. The KISS document is in the file kisstnc.ms.Z which
is a compressed Unix troff format file.

The KISS TNC:
A simple Host-to-TNC communications protocol
.AU
Mike Chepponis, K3MC
.AU

Phil Karn, KA9Q
.AB
The KISS**
.FS
"Keep It Simple, Stupid"
.FE
TNC provides direct computer to
TNC communication using a simple protocol described here. Many TNCs now implement it, including the TAPR TNC-1 and
TNC-2 (and their clones), the venerable VADCG TNC, the AEA PK-232/PK-87 and all
TNCs in the Kantronics line. KISS has quickly become the protocol of choice for TCP/IP operation and multi-connect BBS software.
.AE
.NH
Introduction
.PP
Standard TNC software was written with human users in mind; unfortunately, commands and responses well suited for human use are ill-adapted for host computer use, and vice versa. This is especially true for multi-user servers such as bulletin boards which must multiplex data from several network connections across a single host/TNC link. In addition, experimentation with new link level protocols is greatly hampered because there may very well be no way at all to generate or receive frames in the desired format without reprogramming the TNC.
.PP
The KISS TNC solves these problems by eliminating as much as possible from the TNC software, giving the attached host complete control over and access to the contents of the HDLC frames transmitted and received over the air. This is central to the KISS philosophy: the host software should have control over all TNC functions at the lowest possible level.
.PP
The AX.25 protocol is removed entirely from the TNC, as are all command interpreters and the like. The TNC simply converts between synchronous HDLC, spoken on the full- or half-duplex radio channel, and a special asynchronous, full duplex frame format spoken on the host/TNC link.
Every frame received
on the HDLC link is passed intact to the host once it has been translated to the asynchronous format; likewise, asynchronous frames from the host are transmitted on the radio channel once they have been converted to HDLC format.
.PP
Of course, this means that the bulk of AX.25 (or another protocol) must now be implemented on the host system. This is acceptable, however, considering the greatly increased flexibility and reduced overall complexity that comes from allowing the protocol to reside on the same machine with the applications to which it is closely coupled.
.PP
It should be stressed that the KISS TNC was intended only as a stopgap. Ideally, host computers would have HDLC interfaces of their own, making separate TNCs unnecessary. [15] Unfortunately, HDLC interfaces are rare, although they are starting to appear for the IBM PC. The KISS TNC therefore becomes the "next best thing" to a real HDLC interface, since the host

computer only needs an ordinary asynchronous interface.
.NH
Asynchronous Frame Format
.PP
The "asynchronous packet protocol" spoken between the host and TNC is very simple, since its only function is to delimit frames. Each frame is both preceded and followed by a special FEND (Frame End) character, analogous to an HDLC flag. No CRC or checksum is provided. In addition, no RS-232C handshaking signals are employed.
.PP
The special characters are:
.PP
.TS
center box tab(/);
l l l .
Abbreviation/Description/Hex value
=
FEND/Frame End/C0
FESC/Frame Escape/DB
TFEND/Transposed Frame End/DC
TFESC/Transposed Frame Escape/DD
.TE
.PP
The reason for both preceding and ending frames with FENDs is to improve performance when there is noise on the asynch line. The FEND at the beginning of a frame serves to "flush out" any accumulated garbage into a separate frame (which will be discarded by the upper layer protocol) instead of sticking it on the front of an otherwise good frame.
As with back-to-back flags in
HDLC, two FEND characters in a row should not be interpreted as delimiting an empty frame.
.NH
Transparency
.PP
Frames are sent in 8-bit binary; the asynchronous link is set to
8 data bits, 1 stop bit, and no parity.
If a FEND ever appears in the data, it is
translated into the two byte sequence FESC TFEND (Frame Escape, Transposed Frame End). Likewise, if the FESC character ever appears in the user data, it is replaced with the two character sequence FESC TFESC (Frame Escape, Transposed Frame Escape).
.PP
As characters arrive at the receiver, they are appended to a buffer containing the current frame. Receiving a FEND marks the end of the current frame. Receipt of a FESC puts the receiver into "escaped mode",
causing the receiver to translate a following TFESC or TFEND back to FESC or FEND, respectively, before adding it to the receive buffer and leaving escaped mode. Receipt of any character other than TFESC or TFEND while in escaped mode is an error; no action is taken and frame assembly continues. A TFEND or TESC received while not in escaped mode is treated as an ordinary data character.
.PP
This procedure may seem somewhat complicated, but it is easy to implement

and recovers quickly from errors. In particular, the FEND character is never sent over the channel except as an actual end-of-frame indication. This ensures that any intact frame (properly delimited by FEND characters) will always be received properly regardless of the starting state of the receiver or corruption of the preceding frame.
.PP
This asynchronous framing protocol is identical to "SLIP" (Serial Line IP), a popular method for sending ARPA IP datagrams across asynchronous links. It could also form the basis of an asynchronous amateur packet radio link protocol that avoids the complexity of HDLC on slow speed channels.
.NH
Control of the KISS TNC
.PP
Each asynchronous data frame sent to the TNC is converted back into "pure" form and queued for transmission as a separate HDLC frame. Although removing the human interface and the AX.25 protocol from the TNC makes most existing TNC commands unnecessary (i.e., they become host functions), the TNC is still responsible for keying the transmitter's PTT line and deferring to other activity on the radio channel. It is therefore necessary to allow the host to control a few TNC parameters, namely the transmitter keyup delay, the transmitter persistence variables and any special hardware that a particular TNC may have.
.PP
To distinguish between command and data frames on the host/TNC link, the first byte of each
asynchronous frame between host and TNC is a "type" indicator. This type indicator byte is broken into two 4-bit nibbles so that the low-order nibble indicates the command number (given in the table below) and the high-order nibble indicates the port number for that particular command. In systems with only one HDLC port, it is by definition Port 0. In multi-port TNCs, the upper 4 bits of the type indicator byte can specify one of up to sixteen ports. The following commands are defined in frames to the TNC (the "Command" field is in hexadecimal):
.PP
.TS
box expand tab(/);
l l l .
Command/Function/Comments
=
0/Data frame/T{
The rest of the frame is data to be sent on the HDLC channel.
T}
_
1/TXDELAY/T{
The next byte is the transmitter keyup
delay in 10 ms units.
The default start-up value is 50 (i.e., 500 ms).
T}
_
2/P/T{
The next byte is the persistence parameter, p, scaled to the
range 0 - 255 with the following formula:
.sp

```
$ P = p * 256 - 1 $
.sp
The default value is P = 63 (i.e., p = 0.25).
T}
_
3/SlotTime/T{
The next byte is the slot interval in 10 ms units.
The default is 10 (i.e., 100ms).
T}
_
4/TXtail/T{
The next byte is the time to hold up the TX after the FCS
has been sent, in 10 ms units.  This command is obsolete,
and is included here only for compatibility with some existing
implementations.
T}
_
5/FullDuplex/T{
The next byte is 0 for half duplex, nonzero for full
duplex. The default is 0 (i.e., half duplex).
T}
_
6/SetHardware/T{
Specific for each TNC.  In the TNC-1, this command
sets the modem speed.  Other implementations may use this
function for other hardware-specific functions.
T}
_
FF/Return/T{
Exit KISS and return control to a
higher-level program.  This is useful only when
KISS is incorporated into the TNC along with other
applications.
T}
.TE
.PP
The following types are defined in frames to the host:
.TS
box expand tab(/);
l l l .
Type/Function/Comments
=
0/Data frame/T{
Rest of frame is data from the HDLC channel
T}
.TE
.PP
No other types are defined; in particular, there is no provision for
acknowledging data or command frames sent to the TNC.
KISS implementations must ignore any unsupported command types.
All KISS implementations must implement commands 0,1,2,3 and 5; the others
are optional.
.NH
```

Buffer and Packet Size Limits
.PP
One of the things that makes the KISS TNC simple is the deliberate lack of TNC/host flow control. The host computers run a higher level protocol (typically TCP, but AX.25 in the connected mode also qualifies) that handles flow control on an end-to-end basis. Ideally, the TNC would always have more buffer memory than the sum of all the flow control windows of all of the logical connections using it at that moment. This would allow for the worst case (i.e., all users sending simultaneously). In practice, however, many (if not most) user connections are idle for long periods of time, so buffer memory may be safely "overbooked". When the occasional "bump" occurs, the TNC must drop the packet gracefully, i.e., ignore it without crashing or losing packets already queued. The higher level protocol is expected to recover by "backing off" and retransmitting the packet at a later time, just as it does whenever a packet is lost in the network for any other reason. As long as this occurs infrequently, the performance degradation is slight; therefore the TNC should provide as much packet buffering as possible, limited only by available RAM.
.PP
Individual packets at least 1024 bytes long should be allowed. As with buffer queues, it is recommended that no artificial limits be placed on packet size. For example, the K3MC code running on a TNC-2 with 32K of RAM can send and receive 30K byte packets, although this is admittedly rather extreme. Large packets reduce protocol overhead on good channels. They are essential for good performance when operating on high speed modems such as the new WA4DSY 56 kbps design.
.PP
.NH
Persistence
.PP
The P and SlotTime parameters are used to implement true p-persistent CSMA. This works as follows:
.PP
Whenever the host queues data for transmission, the TNC begins monitoring the carrier detect signal from the modem. It waits indefinitely for this signal to go inactive. When the channel clears, the TNC generates a random number between 0 and 1.**
.FS
To conform to the literature, here p takes on values between 0 to 1. However, fractions are difficult to use in a fixed point microprocessor so the KISS TNC actually works with P values that are rescaled to the range 0 to 255.
To avoid confusion, we will use lower-case p to mean the former (0-1) and upper-case P whenever we mean the latter (0-255).
.FE
If this number is less than or equal to the parameter p, the TNC keys the transmitter, waits .01 * TXDELAY seconds, and transmits all queued frames. The TNC then unkeys the transmitter and goes back to the idle state. If the random number is greater than p, the TNC delays .01 * SlotTime seconds and repeats the procedure beginning with the sampling of the carrier detect signal. (If the carrier detect signal has

gone active in the meantime, the TNC again waits for it to clear before continuing). Note that $p = 1$ means "transmit as soon as the channel clears"; in this case the p-persistence algorithm degenerates into the 1-persistent CSMA generally used by conventional AX.25 TNCs.

.PP

p-persistence causes the TNC to wait for an exponentially-distributed random interval after sensing that the channel has gone clear before attempting to transmit. With proper tuning of the parameters p and SlotTime, several stations with traffic to send are much less likely to collide with each other when they all see the channel go clear. One transmits first and the others see it in time to prevent a collision, and the channel remains stable under heavy load. See references [1] through [13] for details.

.PP

We believe that optimum p and SlotTime values could be computed automatically. This could be done by noting the channel occupancy and the length of the frames on the channel. We are proceeding with a simulation of the p-persistence algorithm described here that we hope will allow us to construct an automatic algorithm for p and SlotTime selection.

.PP

We added p-persistence to the KISS TNC because it was a convenient opportunity to do so.

However, it is not inherently associated with KISS nor with new protocols such as TCP/IP.

Rather, persistence is a \fIchannel access\fR protocol that can yield dramatic performance improvements regardless of the higher level protocol in use; we urge it be added to \fIevery\fR TNC, whether or not it supports KISS.

.NH

Implementation History

.PP

The original idea for a simplified host/TNC protocol is due to Brian Lloyd, WB6RQN. Phil Karn, KA9Q, organized the specification and submitted an initial version on 6 August 1986. As of this writing, the following KISS TNC implementations exist:

.PP

.TS

_

AEA PK-232 & PK-87/Steve Stuart, N6IA/T{

Integrated into standard AEA
firmware as of 21 January 1987.
The special commands "KISS ON"
and "KISS OFF" (!) control entry
into KISS mode.
T}
_
Kantronics/Mike Huslig/T{
Integrated into standard Kantronics
firmware as of July 1987.
T}
.TE
.PP
The AEA and Kantronics implementations are noteworthy in that the KISS functions were written by those vendors and integrated into their standard TNC firmware. Their TNCs can operate in either KISS or regular AX.25 mode without ROM changes. Since the TNC-1 and TNC-2 KISS versions were written by different authors than the original AX.25 firmware, and because the original source code for those TNCs was not made available, running KISS on these TNCs requires the installation of nonstandard ROMs. Two ROMs are available for the TNC-2. One contains "dedicated" KISS TNC code; the TNC operates only in the KISS mode. The "download" version contains standard N2WX firmware with a bootstrap loader overlay. When the TNC is turned on or reset, it executes the loader. The loader will accept a memory image in Intel Hex format, or it can be told to execute the standard N2WX firmware through the "H"** command. The download version is handy for
.FS
For "Howie", of course.
.FE
occasional KISS operation, while the dedicated version is much more convenient for full-time or demo KISS operation.
.PP
The code for the TNC-1 is also available in both download and dedicated versions. However, at present the download ROM contains only a bootstrap; the original ROMs must be put back in to run the original TNC software.
.NH
Credits
.PP
The combined "Howie + downloader" ROM for the TNC-2 was contributed by WA7MXZ.
This document was carefully typeset by Bob Hoffman, N3CVL.

You've entirely missed (ignored?) my point. The bitty-boxboys are
carping that OTHERS are not supporting their machines with state of
the art software. As Phil Karn said in a reply to your posting, the
source code is available to them. If they want full-blown NOS on a C-64,
TI99-4, or T/S 1000, implement the amateur tradition of building, fixing,
and modifying (as mentioned above) and _do_ it, just as the Germans have
done with DIGICOM. But PLEEZE stop crying about it.

This is vaguely reminiscent of the CBers that wouldn't sit down long
enough with a Farnsworth tape to learn CW, so they griped and moaned
until the FCC et al instituted a no-code license. Now they'll bellyache
about the ferschluginner theory test being too hard, good buddy, until
they get rid of it, too. Perhaps they'll also get rid of our frequencies
and leave us with 26.965-27.405, and a couple of slots above 450? UPS
would love that-:)

I suppose what I'm trying to say is "talk is cheap". Or "If you want
something done, do it yourself".

> The holy wars have moved to packet so soon? The only place with any peace is
> CW, abuse in morse is such hard work.
>
yup - no Commode-odors there......

(Actually, I think the C-64 is a nice little machine, and there are
some rather impressive things written in 6809 machine code for it.....)

    PCs are CURRENTLY very popular, and don't show any sign of going
away soon. I concede that willingly. The point I've been trying to make
all along is that THERE ARE OTHER THINGS OUT THERE. Amigas, Atari STs,
Sparcstation SLCs, machines that are pretty appealing to users who want
to do more than just log into the local bulletin boards. Please don't
feel compelled to "stomp out" anything else just because it is different.
The AM people felt compelled to fight with the SSB people many years ago.
It wasn't that long ago I heard CP/M people fighting with the DOS people.

   There is another issue with the argument "Oh, I'll just have an XT
clone in addition to my new Unix box/workstation.". Every computer
presents a source of RFI. The fewer the computers in your shack, the
easier it will be for you to clean up RFI sources. Many of the newer

machines, like Amigas and Ataris, are quite clean already. Many of
the XT clones are notoriously dirty.

>Every unix box I've had
>the opportunity to work with either comes with or can be configured for
>a bisync port. These ports, usually implemented as intelligent peripherals,
>are more than capable of 56kb. A driver and pump code to assemble ax.25

>SCSI devices. So why not just write the driver and provide cabling
>information to connect the modem directly to the bisync port? I'll bet
>GRAPES would even distribute this information with the kits.

   I cry FOUL! on the comment "can be configured for". Do you mean an
adaptor card can be purchased? How much does it cost? Hmmm... Don't
fall into a common trap, which can be summarized in the following line:

  "I've got a better solution for this one piece of specific hardware"

   If I was designing a interface for PS/2s and PS/2s only, I might make
an MCA plug in card, or use the bi-directional parallel port. If I was
designing a connection for a system which has a useful Multi-Protocol
port, I would probably build a cable and write a driver. If I was making
an XT only interface, I'd use one of the evil plug in cards.

  But my design is not just for one system, and it isn't intentionally
limited to just those systems that exist today. Workstation class machines
are dropping in price, and the ones in use today may be available as
used gear in a few years. Furthermore, it isn't JUST workstations that
are coming out of the box equipped with SCSI (is an Amiga a workstation?).
Please keep in mind I started out with something like a "what if?" attitude.
What if people had a SCSI TNC? What are the benefits and disadvantages? As
I started to build a clear picture, SCSI started to look pretty good. I have
received many comments of the nature "Oh, I've already got a SCSI adapter
in my PC for my disk drives; I could plug a SCSI TNC into that?" or "Hey,
this would be a good reason to buy that SCSI interface I've been putting
off".

    This is not a "PCs vs. Workstations" battle. This is simply one new
idea that may ease the use of future new computers in packet radio. But,
given the way the amateur community is today, I can see how a new idea
may be offensive.

There's one important difference: I provide full source code, so if
you're interested you can go into the code, take it apart, figure out
how it works, add new features, change those you don't like, etc.
Software hacking is as much a form of homebrewing as building hardware.

Phil

KISS-mode seems like a nice mode to use if you want to create your own
software for a TNC. For example using a PC as a host for a node or BBS.
However, this requires the knowledge of KISS-mode, something we haven't
got.
So if anyone has documentation of what the TNC recognizes as commands

, what you should feed it with and what kind of format the output comes in.
(Seems like some characters get the doubled ASCII-value.)
We at the Club at Lunds Institute of Technology ,Sweden would greatly
appreciate a e-mail of some kind.

I am also interested in any packet software available for Xenix,
particularly TCP/IP stuff. I have some Intel 310 systems and want to
set up a node. I know that KA9Q exists in Unix source, but not being
a Unix wizard, I don't know the difficulty of porting to Xenix, let alone
making it work in the first place. Thanks in advance.

I want to replace my GLB TNC-2 with a better modem.

I was all set to get the PK-232 when a friend at Dayton who was
selling his PK-232 recommended the KAM.

Any opinions would be appreciated.

Also do I need the additional software for the modems?
I am currently using PTP with the TNC-2.
Are there better programs than the ones the modem manufacturers sell?

I am posting this for a friend that can'nt do it himself.
This program will take a standard hosts.net file and convert it to
domain.net file. It doesn't transfer the comments over but will convert all
entries to the new format, also the first entry is considered to be the
master entry.

You can reply to me and I can forward you comments.

i just recieved an answer from Heath Co telling me that there are NO
upgrades to the HD4040 tnc. i am fairly sure that i remember a few
months ago someone on the net upgraded theirs. if anyone has any
information on how to upgrade the HD4040 please send answers directly
to me.   THANK-YOU in advance.

>X-Mailer: Mush 6.5.6 (PC R6.3 22-Sep-89)

The G3RUH can't do full-duplex? I don't see why that would be. By my
recollection he uses the TX clock as the reference for the DPLL that
extracts the RX clock and that should work OK as long as the remote TX
clock is reasonably close in frequency to the local TX clock. If not,
you could always chop it and put in your own clock.

While we're at it, does anyone know why he has what appears to be an
analog loop filter in his DPLL? I guess it is really a Hybrid PLL.
It seems to me cheaper/easier to do that filter in logic.

I have a problem which some of you may have already run into and I hope can offer some advice on. Some friends and I were planning on running TCP/IP on the local packet network. When various people got wind of this, particularly the folks who have turned all the major local digipeaters into ROSE nodes (it's their equipment), I started hearing 'concerns' about TCP/IP's effect on the packet channels.

Most of the concerns seem to center around increased congestion on the packet channel we chose to run on. I've monitored that frequency (145.01) and detect very little activity on it and therefore don't really see what the big concern is all about. The number of people who are considering experimenting with TCP/IP is less than a dozen. Yet, some folks have told me that they have 'heard' stories of a few TCP/IP stations tying up packet channels elsewhere on the mainland.

Another concern is that some folks have invested heavily into turning their TNCs into ROSE nodes and don't want to see their investment in time and money go to waste. This concern has me a bit confused - as long as a ROSE node can perform traditional AX.25 digipeating I don't see why their efforts are being wasted. Is there something about KA9Q digipeating through a ROSE node that I should know about?

Other concerns seem to result from a lack of understanding just what TCP/IP is all about and how it fits in with AX.25. Most hams around here don't even understand AX.25 or the OSI reference model. Does there exist a short collection of important Questions & Answers about TCP/IP, as it applies to ham radio, and where can I find it? I may have to do a little bit of educating to alleviate

some imagined fears.

I will be traveling up to the mainland for one semester to do some
research beginning in August so I don't have much time left to
continue playing mid-wife to this as yet unborn network. I am
seriously tempted to drop the project until I return in half a
year. But the problems previously mentioned will still be there.
I would appreciate hearing anyone's thoughts on the above
especially if they can help me anticipate some of these 'concerns'.

I recently bought a handful of 80C152JC chips from Intel. These are
16 Mhz 80C51 CPUs with an SDLC controller integrated on chip. My intention
is to use these in low parts count 56 kb/s KISS TNCs (1 cpu + 1 EPROM + 1 RAM
+ 1 latch + 1 rs-232 chip). Current drain should be low (< 100 mA at 5V).
(I plan to power then with the little wall adapters (9VDC@150 mA type things)).
Right now, I need to build two so they can talk to each other for testing.
At some point I need to hook up with someone who has 56 kb/s modems (like
the recently discussed GRAPES modem) to actually try these things.

  (a) is there anyone around So Cal who is working with 56 kb modems?
  (b) is this pointless given that anyone can put an Eagle in a PC and
      run 56 kb/s (I'm assuming this is true) ?

 * Point (b) is mitigated by the fact that someone may wish to hook up a
non-PC (like a mainframe) to packet.

I think I know what 'the other' people were worried about. It is
possible to totally, completely hog a channel with KA9Q net, but
it doesnt have to be that way. You can change the window sizes
that net uses to be just about anything you want. If you set it
up to transmit 4000 byte packets, it will take about 10 seconds to
transmit it. This gives the appearance of hogging the channel, and
it does. What you have to do is make a good impression, and keep
you tcp window's to a value that is fair to other users on the
channel, like maybe 256 instead of 4000 or 8000, etc. If you
experiment, you will find that large windows can make a drastic
improvement on thruput, and I expect that some people have taken
advantage of that on a shared channel, thus giving TCP/IP a bad
name. Phil Karn (KA9Q) has just put in alot of info on how to
adjust the window's and such into the NOS documentation. If you read
it you will be able to set things up on a shared channel.

Saying all that - please be aware that KA9Q TCP/IP is designed to NOT
hog the channel, because it will backoff it's transmissions if it
detects collisions. Also, it uses KISS mode which has programmable
parameters to keep things flowing right on the channel.

SO.....

If you are on a public, shared channel - keep reasonable and sane
windows and they won't even know you are there.

If you have your own private TCP/IP only channel, open things up
to the max, and they will drool with envy when they see your
thruput.

I urge you to experiment/study these things, and then please
have a meeting with these people to set the record straight. There
is no reason that TCP/IP should have a bad name.

Jeff

It seems that this myth will never die. I have worked very hard to make my TCP/IP/AX.25 code about the most "channel-friendly" software in amateur packet radio by including the following features. Most are, as far as I know, unique to my code:

1. Both my TCP and AX.25 code automatically measure the times taken to receive acknowledgements and use them to set their retransmission timers (commonly referred to as "FRACK" in AX.25 TNCs). More recent versions do a more sophisticated set of measurements suggested by Van Jacobsen. The variance of the round trip time is also measured, yielding a measure of the "unpredictability" in the path. I.e., the more unpredictable the round trip time, the longer the timeout even if the average remains the same. This set of procedures dramatically reduces the unnecessary retransmissions you see so often from plain AX.25 TNCs with fixed, "triggerhappy" FRACK settings.

2. Both TCP and AX.25 "back off" on each retransmission. That is, for each unsuccessful retransmission attempt, the timeout is doubled for the next attempt. This provides some negative feedback when the channel gets congested.

3. The KISS TNC, which was originally developed specifically for TCP/IP operation (but is not limited to it), specifies the use of "p-persistence" for channel access. When properly configured, p-persistence greatly reduces the "jump on" phenomenon whereby several stations waiting for the channel all begin to transmit the instant the station already on the channel finishes.

I should point out that in packet radio, as in real life, being a nice guy usually means you finish last. Stations using my code often get much poorer throughput when they have to contend with more agressive stations that don't follow the same rules (which means almost other stations). Many users of my code have long complained about this and some have made local modifications to increase its "agressiveness", but I have resisted such measures in the standard version because I want to set an example.

The only valid basis for complaint about TCP/IP is that it is so useful and convenient a tool for transferring mail and files that its users can easily keep a channel busy for hours with little effort. That's why I've worked very hard to make my code as deferential as possible to other traffic on the channel.

The KISS TNC interface is documented in the paper "The KISS TNC: A
Simple Host-to-TNC Communications Protocol" by K3MC and myself. It
appears in the proceedings of the 6th ARRL Computer Networking Conference
held in Redondo Beach CA on August 29, 1987.

I believe you can find the troff source to this paper on flash.bellcore.com;
however that machine is down right now so I can't check.

I, and several others, are searching for TCP/IP sources which have been
ported to SCO Xenix.

Sources, assistance and/or leads most appreciated.

Thanks!

Noel

The static inertia of society is tremendous, and it is no better in
many parts of the ham-radio community. Here are a few other pieces
of resistance I have personally encountered:

- Equipment. "Will my C-64 work?" "Is there a CP/M version for my
     shoe-box that I bought for $20.00 at a hamfest?" etc.
     I'm not sure if these people feel "threatened" that their
     "stuff" will be forced into an early grave, but there
     needs to be an effort to educate people that this stuff
     already *IS* outdated. The concensus _seems_ to be that
     those of us who are CAPABLE of doing development on
     this hardware choose not to do development because we
     are snobbish (stuck up, arrogant, etc.) about our hard-
     ware. In reality, enough people have found that such
     development is not worthwhile (for one reason or another)
     that there _must_ be some reason for it.

- Unprintable characters. This is one of my favorites. I have gotten many, many dirty looks from people who have met me with comments about how my TCP/IP "garbage" has locked up their terminal or computer, or gone through a whole box of paper. I'm not sure why everybody is printing out ALL activity on the channel, but there are lots of people doing it. (I have thought on occasion that if I were IP coordinator, I would assign addresses made up of combinations of formfeeds and bells :-) :-) :-) hehehe)

- "What we've got now works, so don't mess with it." This one makes me madder than h ... (better not say it). My best example is with binary file transfer. Software updates were coming from across the lake, and I suggested that binary FTP would be a great way to do it. A room full of people told me that they'd rather BSQ (sorta like uuencode) the whole thing and transfer it into a capture buffer, then decode it back to binary. Talk about freq. clogging -- in addition, you're not adding ANOTHER 50% overhead.

- Commercial interconnection. Many people hear "TCP/IP" and think, gee, next we'll be plugging into Internet and our default routing will be landline. I personally see a lot of merit to having a few "wormholes" until we have a truly national IP network, but I _don't_ think this is the goal.

- "I don't like the way TCP/IP handles e-mail". I am **TOTALLY** without explaination for this one. When I asked why, I only got, "I just don't like it." The idea that TCP/IP is a suite of protocols has not gotten through to the non network-y types; perhaps this is part of the problem?

Right now, I am running PA0GRI NOS. It is VERY unstable (if someone has made the GRI mailbox work with a more recent version of NOS, **PLEASE** let me know!!!) Using this software has helped to a degree, because of the gateway features, and because of the organization of the mailbox. Another good package is MSYS, a BBS which supports TCP/IP. (MSYS is missing one thing: you can only telnet to the sysop, you can't telnet into the BBS).

My approach to a lot of these problems hinges on me getting a new computer, running U*ix, because I feel I can do a much better job of presenting what TCP/IP can do once I get some remotely-accessible software running. DOSGATE is a neat idea; a Unix "version" of this idea would really be a knockout!!!

Best 73's
     Chris, N2JGW

I am considering purchasing a CD-ROM player for my computer, with the
ham-radio callsign database. Before I do this, I want to know that
the thing will work under Unix (it's meant for DOS). Has anybody
any experience with this contraption? Specifically, does it look
(to the kernal) enough like a floppy or hard drive that I could
"mount" it from Unix as a dos partition, and access the database?

(Also: does anybody out there know how this callsign database gets
updated, and what it costs to get the new discs?)

I too would like to run nos on my 286 Box running SCO Xenix, If
anyone has done this port, any info would be greatly appreciated.
AS a matter of fact I would be willing to provide compensation for
anyone offering floppies with a running version.

Lot's of ideas and needs, but not much time?

I am running UUCP to my SUN at work and my mail node at Kodak. I
would like to be able to also run tcpip for other HAMS to use
my unix (like) Box via my DRSI board or my tiny 2. Thanks in advance.

I would point out that there are situations where the TNC approach is
still necessary. Laptop computers instantly come to mind as do Macintoshs.
Also Unix boxes such as this one. I am excited about the Kantronic Data
Engine as an semi-intelligent front end for my system. If you have a DOS
PC with slots, then the plugin cards are great. I'm running a DRSI on
a PC too, but it won't work with my laptop and I'm not up to writing a
device driver for Unix yet.

Now you see one of the reasons I'm so strongly in favor of a no-code license
that would attract more technically oriented people to the service.

I certainly welcome the participation of any and all existing hams in TCP/IP
and related developments such as DREAMNET (N6GN et al's megabit microwave
project), but I harbor no illusions about ever garnering more than a small
fraction of the existing amateur population. That's why it's important to go
outside the existing pool for new blood.

Can anyone tell me what the exact deviation is on a DVR-2 running a G3RUH
modem at 9600 baud? My calculations come up to somewhere around +/- 8 Khz
for a total bandwidth of around 16 Khz, but I would appreciate hearing from
someone who might actually be using this setup and has measured it "under
load" so to speak.

I am putting this setup on a 1500 foot tower and need to put a crystal
filter in the front end of the DVR-2 and am trying to figure out exactly
what I need to tell the people that are going to make it. :-) I figured
that if it spec'ed out at 20 Khz that I would be OK.

Comments? Help? Words of Wisdom?

Thanks!

Mark Bitterlich

  We have Ham Radio Micro Bits here in Portland, OR. It is dedicated
totally to all phases of Amateur Radio. The number is (503) 285-0378 and is
online 24 hours. I'm also very interested in Ham Radio, especially packet,
and carry the rec.ham-radio.* news groups here. See below for the info on
my system. ;-) ;-)

Hmm. I am WAY out of touch when it comes to what's presently in NOS.
My head is totally spinning when it comes to which software does what,
and what version I should be using, etc.

It seems that my version has a "remote" command, where you could say
"remote kick n2jgw.ampr.org" and force my machine into trying to
smtp out whatever it had, but it doesn't seem to be selective (for
instance, be able to say 'wb2abc just kicked me, I'll just send stuff

to him, if I have any'. This may already exist without my being aware
of it.

However, even with all of the nntp talk, etc. that's been going on,
I know that I personally don't feel satisfied with regard to what
form the old RLI-style BBS's will take in a TCP/IP world. MSYS would
be a good place to start, if you could telnet into the BBS.

I have a local change to the NOS software that allows you to TURN THE
MACHINE OFF, yet still get your mail. The changes use the POP protocol,
and the concept is to move your e-mail box from a system that is up 24
hrs/day to your system on demand. We have called that SLURPING the
mailbox. During testing a SUNOS system was used as the base mail system.
We also have patched a POP server side together under NOS. The project has
set idle for about 8 weeks now, if someone would like to take the pieces
and do the polishing, or use the work as a base to start over please

contact me.

I really feel that mail delivery on demand to your NOS system will be
a required feature before NOS is ready for the masses.

I was very interested in the fact that a DVR2-2 and a G3URH modem could
be used together. I was at the ARRL National Hamfest in Kansas City
this weekend and ask Karl Medcalf, WK5M about how much deviation that
configuration used. He responded by saying "about legal limit".

Rather impressive to see 2 Date Engines with G3URH modems transfer a text
file across the room at 9600. Makes my landline modem seem slow!

Could someone point out some references on TCP/IP suitable for the
non-computer-expert packet user? I've been using packet radio for about 2
years now. I mostly get on my local BBS, sometimes crossposting articles from
packet to UUCP, and vs versa. Is TCP/IP meaningful to me? How does it differ
from what I'm used to (ROSE and regular TNCs)? (any of this making sense? :-)
I think it has something to do with the way e-mail and postings are sent
around the packet BBS network. (I'm using an old Atari 800 8bit computer with
a KPC2 tnc and a crystal controlled 2m radio, if it matters. Do you need
"KISS" for TCP/IP?)   signed: Confused.

Maybe some expert should write an "Idiot's guide to TCP/IP"?

How about packet operation in general? I have ordered the ARRL book,
but am cautious about getting steered toward standards that are already
obsolete. On the other hand it would be no fun to be the only ham for a
hundred miles who could handle 10 megabaud at 25 Ghz even if it is the
wave of the future.

Many newsgroups have a monthly intro posting with answers to commonly
asked questions. Are there any knowledgeable volunteers out there who
could cut and paste the great answers of the recent past?

The best introduction I've seen so far is the one Gary Ford mentioned here a few weeks ago. Here's a rehash of his posting for those who missed it.

From: ford@iris.ucdavis.edu (Gary Ford)
Newsgroups: rec.ham-radio.packet
Subject: Beginner's Guide to TCP/IP
Date: 15 May 90 23:00:27 GMT

I have written a document entitled "Beginner's Guide to TCP/IP on the Amateur Packet Radio Network Using the KA9Q Internet Software." This 44 page guide documents the use of NET v890421.1 and BM v3.3.1 on an IBM PC or clone with a serial interface to a TNC running the KISS firmware.

The guide is available by anonymous ftp from clover.ucdavis.edu [128.120.57.1] as the 113K ASCII file "begin.doc" in the directory /pub/ka9q. Comments and suggestions for change to the document are welcome.

I'm sure someone will ask why the guide documents NET now that NOS is available. The main reason is that NET is most commonly in use in my area. When I helped to set up a TCP/IP switch, the users needed a better manual, so I took a shot at writing one. My next project is to

attempt to port NOS to my Sys5 (actually HP-UX) machine, using Anders Klemets porting kit. If I have success, I'll edit the guide to cover NOS.

     Gary Ford, N6GF

> I have a problem which some of you may have already run into and I hope can offer some advice on. Some friends and I were planning on running TCP/IP on the local packet network. When various people got wind of this, particularly the folks who have turned all the major local digipeaters into ROSE nodes (it's their equipment), I started hearing 'concerns' about TCP/IP's effect on the packet channels.
>
> Most of the concerns seem to center around increased congestion on the packet channel we chose to run on. I've monitored that frequency (145.01) and detect very little activity on it and
>
> .
> .
> .

The concerns can be valid and work in both directions. Your average typewriter-CB packet user doesn't necessarily require great performance from the network nor put a great strain on it. When you get a TCP/IP station transfering a couple hundred K file on the same channel then throughput of the other users of the channel can be affected.

At the same time I am told that there are performance problems on mixed netwroks for the TCP users. When collisions do occur the TNC will retransmit whenever it thinks it can get in while the TCP station will back off, politely stepping aside. This means the X-25 TNC gets to use the channel more often than the TCP station.

Another problem is the mode of operation. PAUs typically will switch the 2m rig off the local repeater and over to the TNC when they want to use it, running a hundred or so watts into the omni antenna. To get proper benefit a TCP station is usually dedicated to the purpose and running proper power into a beam into the repeater or switch site.

I think the proper way to run things is to establish full duplex repeaters, probably on 440 or above, greater than 1200 baud and use beams to "work" the repeater. Using a repeater eliminates hidden transmitter problems and since you are working point-to-point the use of beams and reduce the QRM to same channel repeaters allowing more re-use of the frequency pair.

Some things, like long distance backbones can be shared between the protocols. In New England some long distance links use NETROM nodes to connect them.

In summary, the things that you use TCP for, like transfering files, can increase traffic per user over a typical PAU. The algorithms used to send a packet can cause TCP stations to lose on shared channels. I reccomend finding a separate channel for local TCP use and sharing long distance nodes.

These are just my opinions and thoughts. Hope they help.

9th Computer Networking Conference

The American Radio Relay League
The Canadian Radio Relay League

Plan to participate in the 9th Computer Networking Conference,

jointly sponsored by ARRL and CRRL, to be held this September in Canada--the country that first brought you packet radio! Here are the details:

TIME AND DATE: 9 AM to 5 PM, Saturday, 1990 September 22

LOCATION: London Regional Art Gallery and Museum, 421 Ridout Street North, London, Ontario

REGISTRATION: $US 20 or $CDN 25. Registration fee includes a copy of the conference proceedings and a catered hot lunch.

A WORD ABOUT THE LOCATION: London, Ontario, population 270,000 is located in Southern Ontario midway between Detroit, Michigan, and Buffalo, New York (or Toronto, Ontario). London is accessible by car via Highway 401, rail or air. While no major airlines have direct service to London, excellent commuter service to Toronto and Detroit is provided by Air Ontario (Air Canada) and Canadian Partner (Canadian Airlines International). ComAir (Delta) provides connector service from Cincinnati and Cleveland, Ohio. For those in the US that might want to take in a bit of countryside, flying to Detroit or Buffalo, or to Niagara Falls, New York, and renting a car for the 2-3 hour trip to London can be a cost-effective alternative to flying directly. Check with your travel agent for details. The London Regional Art Gallery and Museum is located in downtown London, overlooking Harris Park at the forks of the Thames River. There is adequate free parking nearby.

A WORD ABOUT ACCOMMODATIONS: Conference organizers have negotiated a special flat rate of $CDN 85 a night (no limit to the number of people allowed to stay in one room) at the 322-room Radisson Hotel, London Centre, located about four blocks from the conference site. it is highly recommended that conference participants stay at this hotel to facilitate organizing Friday-night dinners and informal get-togethers. (A list of alternate accommodations can be furnished on request.) Conference participants must make their own reservations at the Radisson. Use the toll-free number (800) 333-3333 and mention the conference.

A WORD ABOUT THE CONFERENCE: Past computer networking conferences have attracted 120-150 participants from all over the US and Canada--and occasionally from beyond. Conference speakers share the results of recent work at the leading edge of packet radio. All participants hear all speakers--there are no concurrent presentations. Is this a place to find out how to get into packet radio? We would say no. But if you're a beginner and you do attend, you're certain to develop an enthusiasm for this wonderful mode. Is there anything to look at or buy? Not really--it's a conference, not a hamfest. Of course, that doesn't preclude a few interesting displays or demonstrations--or

the deal of a lifetime made in the parking lot! What about
Saturday activities after the conference? Conference organizers
will make arrangements so that everyone who wishes can have
dinner together and a night out at a popular restaurant--a good
way to end the conference.

HOW TO REGISTER: Send $US 20 or $CDN 25 to:
     9th Computer Networking Conference
     c/o Harry MacLean, VE3GRO
     500 Riverside Drive
     London, ON N6H 2R7
Include your name, address and call (if any). You will receive a
confirmation in the mail, along with maps and additional
information related to the conference.

Hello,
I'm not yet a ham, but I have a friend who is and he asked me to post and
find out something about info-hams for him. Unfortunately he is unable
to read news, but he can send/receive mail. Could someone please send
us information on info-hams, so this poor young lad can indulge in
newsfeed on a regular basis? All input is appreciated.

Thank you,
Jonathan S. Bucki

For those w/o access to an open subnet machine (to do the ftp), the Mac
KA9Q (version 2.0), latest BM mailer (900415), and docs are also available
via landline on MacScience BBS (408-866-4933).

I'm having problems with the KA9Q version of NOS. The version I am now trying to use is 900612 and is not a modified copy. I have run other versions of NOS in the past, and have been running G1EMM's version (900522v1.1) up until now with no problem. Here's what I've tried doing & what's happened:

- start up NOS
- at the prompt, type "con tnc phx" ("phx" is the local netrom node)
* connect is successful
- then type "n *" (get a complete nodes list, multiple packets long)
* received the nodelist just fine
- then type "users"
* NOS never tries to transmit after this. The "STA" led never comes on.
- turn trace on: "tra tnc 1111"
* NOS reports that it's sending the TNC packets, still no LED
- do an "asy stat":
```
   tnc: [trig char 0xc0]
    RX: int 1157 chr 1157 ovrn 0 hiwat 1
    TX: int 97 chr 97 sndq 14 CTS int 0
```

My system configuration:
```
    8Mhz XT, 640k
    COM2 serial port
    MFJ-1270 tnc
    Note: the RS232 cable is 3-wire with jumpers: 4 to 5, and 6 to 8 to 20
          at each end.
          (I'm curious about the "CTS" in the asy stat!?! What is that?)
```

Here is some key info from my autoexec.net file:
```
        attach asy 0x2f8 3 ax25 tnc 2048 128 1200
        param tnc 1 40
        param tnc 2 25
        param tnc 3 20
        tcp mss 88
        tcp window 88
        ax25 maxframe 1
        ax25 paclen 128
        ax25 window 128
        mode tnc datagram
        netrom qlimit 1024
        netrom window 1
        mode netrom datagram
        ifconfig netrom mtu 108
```

All "irtt's" are set to 32000. Can anyone shed some light? I reported a similar problem a few weeks ago, and Phil mentioned that he had removed the "UART transmitter tickle", and that may have been the problem. I am assuming the "tickle" was put back in on this version, but maybe it slipped thru the cracks.

The whole reason I was going back and trying the KA9Q "original", was because with G1EMM, nobody can seem to connect to the MBOX via netrom or AX.25. They get connected ok, but the MBOX prompt never comes thru. With trace turned on, I can see that my system is sending the MBOX stuff out, but it isn't making it thru the netrom node back to the user. Have I screwed up some parameters? Has anyone else seen this behavior? I can repeat the problem by connecting to the local netrom node, then connecting back to myself. Since I haven't seen anything about it in the "tcp-group" maillist, or here, I figure I have something configured wrong.

Any help would be greatly appreciated.

Phil Karn did indeed take out the transmitter tickle in 900612. I promptly put it back in again! You should find that the g1emm version of 900612 works correctly with the async driver.
As for the mbox funnies over netrom & ax25... I think this may be to do with a mis-match of ax25 frame sizes and the like. We had a similar problem in the UK recently and it was found to be due to a mis-configured paclen and attach command. Please give it a whirl using larger paclen and mtu sizes. If all else fails, try and determine the point of failure. One difference in my version and Phils is that I have slightly different mbox prompt sizes and this may explain the problem. I also don't put a c/r + l/f on the end of the subject prompt during mail sends. This should not cause a problem but I think MSYS tries to use the prompt for automated forwarding, instead of using the MBL type of BBS->BBS forwarding sequence....(Yuck!)
  Hope this helps a bit....
     All the best,
               Kelvin.

>please let me know!

A couple of Estonian stations are active on packet. They connect to our local PacketCluster and BBS's here in Helsinki quite frequently. The distance between Tallinn and Helsinki is only about 70 km - across the Gulf of Finland, so reaching here is not a big problem for the Tallinn fellows. The station I've connected with are ES2WX and ES2RJ.

>==> I don't know a whole lot about packet so I've been reading
>this newsgroup to try and get a feel for it. This attitude really
>burns me - sure, a C-64 may not be ideal for packet radio but not
>all hams are rich.

It all comes back to what you're trying to do. If you're satisfied by defining "packet radio" as having a terminal connect session with a local packet bulletin board system, then great... your C64 will work fine. If you want a more exotic definition of "packet radio", then you may need more horsepower...

It's the same reason you won't find X11 running on a C64.

>Also, why should someone have to
>spend a boatloads of money on equip. for packet if they're not real
>sure whether it's a mode that they'll enjoy?

This reminds me of when, in high-school, I worked for an Apple dealer. The Apple 2 Plus was the rage then, but selling them was a pain. If you sold a guy a system with no floppy disk drive, just the cassette interface, he would find it difficult to use, frustrating, etc., and eventually he'd either want his money back, or he'd want to buy a disk drive. If you tried hard to sell

him a disk drive, he'd moan and groan about the amount of money he was spending on "something I'm not sure I'll like". But almost without exception, the guy who bought the floppy drive would be happy with his system, and the only time he'd be back was to buy software, or more blank floppies, etc.

You can buy a C64 and TNC and define "packet radio" akin to loading BASIC at cassette speeds... and it'll probably do just fine.

>I don't hear folk on HF
>complaining that all hams should buy a digitally synthesized tuner
>so it won't annoy them when your old Drake is 14 Hz off of their
>rice box's frequency. Gee, Wally.

Not exactly the same thing. The modern, digitally synthesized tuner varies in frequency accuracy from the Drake in a merely quantitative way. But some of the things some of us want to include in our definition of "packet radio" are qualitatively different than what is possible with a C64. Apples and Oranges.

>==> I don't believe this! Mr. Karn calls the newcomers `brain dead'
>because either 1) they want to homebrew because they can't afford new
>equipment [or 'cause they enjoy it] OR 2) they're new to packet
>radio and don't know all the ropes.

I don't think this is at all what Phil meant. I personally believe he thinks newcomers are "brain dead" when they expect to accelerate from 0 to 60mph in 6 seconds in an 1100cc VW Beatle, or the equivalent, when they expect to engage in very sophisticated computer to computer networking activities with a C64...

Homebrewing is great... and newcomers are extremely welcome... as long as they have or can learn to have a realistic view of what is achievable with given resources.

>If y'all treat the new Communicator Class licensees like this, the influx of
>`new blood' is not going to help. They'll just get HTs and mobile VHF/UHF
>rigs & talk with their buddies on the local repeater.

This is going to happen, to a certain extent, anyway. The hope with a Communicator Class license is that we will attract more people in to the hobby. You are likely to attract other C64 users. The repeater guys in the area are likely to attract more HT-toting repeater users. Phil and I are likely to attract protocol hackers and digital networking hardware professionals who *do* have Microvaxen, Suns, HP 9000's, etc at home that they are excited about using to help build a "packet radio network" that matches our definition. There's nothing wrong with any of that... it's the way the world works.

>Now, I'm not going to
>claim that the folk working packet MUST help the new guys, but without
>good elmers it is difficult to attract any but the most dedicated
>potential packeteer ... or attract new hams in general.

I have, and will continue to, be an "elmer" to folks in my area interested in

the area of amateur radio that I am interested in... high-speed digital communications. Got a WA4DSY 56kb modem that's not working and live nearby? Sure, I'll help you out! But the 1200-baud variant of "packet radio" has about as much interest to me as working pileups on 20m... assymptotically approaching zero. I'd be a miserable elmer for someone who wants to contest on HF, and I'd be a miserable elmer for someone who wants to use his C64 to contact the local PBBS...

>   Now don't get me wrong - I think innovation is intrinsically a
>good thing, but don't leave the rest of us in the dust. Mark the path
>so we can follow you, step by step, as our finances and our free time
>allow. That is, if you really want more folk who are packet literate.

I think we do. And I think we're marking the trail pretty well. Phil and friends left a couple of marks in the messages you replied to... one is that to play with sophisticated computer networking on radio links, you need more computer than a C64...

Let's see,
     Asbestos jockey shorts?   Check.
     Nomex flame suit?   Check.
     Ready?   Check.
OK, let's go:

Much of the discussion in the thread 'Concerns over TCP/IP' concerns the willingness of various hams who are not a part of the rabid development group to 'get with the program' and be a part of a 24-hour/7-day 'network' (patterned after the Internet) that is the working model for the TCP/IP developers.

Other would-be users who are not willing to do this are disparaged (albeit politely) and relegated to some sub-human class known as 'BBS-users.'

Why must this be so?

Let's face it, the Internet is a GOOD model of a network. The fact that various sites are connected on a 24-hour/7-day basis fuels the fires of development by making sure that messages/files/whatever are available in 'transmission time' to other folks elsewhere.

But the Internet is NOT the ONLY model of a good network. At least as far as 'leaf' sites are concerned. In many organizations, the model of choice is the 'Client/Server' model with 'workstations' as clients and some 'host' as the server. Ideally, the server is up at all times, well-connected to other sites of interest to the organization, and able to support the clients **WHENEVER** they are powered up and attach themselves to the server.

Often (usually?) the workstations are diskless and rely completely on the server for all files and even for downloads of the OS. Users at the workstations boot them up at the beginning of a session (or of the work day), do their thing, and often power down their workstation when done. The server is 'smart' enough to queue mail (without complaint) until a given user logs in.

Hmm. This sounds suspiciously like the much-maligned BBS!

Perhaps the amateur community could be UNITED, rather than split, around TCP/IP if some work were done to develop appropriate server software that runs on top of the TCP/IP package so that workstations/leaf-sites could come and go as appropriate to the USERS' needs without mucking up mail and file transfers. No, I'm not suggesting bootp downloads of DOS over packet, but I AM suggesting that something be done so that the amateur packet community can be united around a superior standard rather than fragmented into this-and-that groups where the BBS users won't talk to the ROSE switchers and the IP'ers won't talk to the keyboarders. etc. etc. sadly etc.

Believe it or not, there are actually hams who regard amateur radio as a

HOBBY and not as a second career. These people should not be locked out of the future simply because they're not workaholics or lack the technical expertise to develop an IP-compliant cilent that runs on a VIC-20.

Come on, guys, lighten up. Computers must serve people, not the other way around!

HI!

I was wondering if anyone was interested in a semi-formal international digital network of people who use 56kb local packet at 220mhz and above and use 10ghz surplus microwave systems to hop between cities. The local clubs could buy the 10ghz stuff and put it at someones house to act as intercity gateways. This could all happen with tcp/ip, the grapes modem and surplus 10ghz stuff. Maybe this has happened already. When is the new digital class going to be ok'd? What will you have to do? Just the test, but no code?

  Considering I'm not a ham yet (cause of the damn code requirement), this probably sounds a bit premature. I just would like to get this set up. An worldwide communications network sounds so slick I wonder why its not illegal. (And you dont have to pay AT&T or telenet...shhh...dont tell anybody!...as long as its non profit). I have some names for the network.. here are some humble suggestions...

    village: for global village
    mag/net: for electromagnetic network (think of all the puns)

I really think something like this would attract a lot of new technically oriented blood. (me for sure!) We could have free fidonet done right and maybe some good hearted person will makea a gateway to usenet/internet

(and then watch the whole community move to packet 'en-masse')

I'm really pumped...somebody tell me why this wouldnt work!

By the way....i really like the idea of a cheap SCSI interface..this would probably be fast enuf for almost all concevable packet speeds.

Jim Burnes

In article <1990Jun19.192026.27378@pmsmam.uucp> wwm@pmsmam.uucp (Bill Meahan) writes:

>Perhaps the amateur community could be UNITED, rather than split, around
>TCP/IP if some work were done to develop appropriate server software that
>runs on top of the TCP/IP package so that workstations/leaf-sites could
>come and go as appropriate to the USERS' needs without mucking up mail
>and file transfers.

Feel free to write such software. Personally, I prefer the standard TCP/IP functions pretty much as they exist. Phil Karn provides you all the source code, so you've got a good head start. At least as far as this USER is concerned, I'm happy. (Well, as happy as anyone can be at 1200 bps...) All us TCP/IP weenies are already united.

>No, I'm not suggesting bootp downloads of DOS over
>packet, but I AM suggesting that something be done so that the amateur packet
>community can be united around a superior standard rather than fragmented
>into this-and-that groups where the BBS users won't talk to the ROSE switchers
>and the IP'ers won't talk to the keyboarders. etc. etc. sadly etc.

Ah, SOMETHING should be done. Presumably SOMEONE should do SOMETHING

about this terrible problem. I wonder who?

>Believe it or not, there are actually hams who regard amateur radio as a
>HOBBY and not as a second career. These people should not be locked out
>of the future simply because they're not workaholics or lack the technical
>expertise to develop an IP-compliant cilent that runs on a VIC-20.

That's a good point. I hack on TCP/IP packet radio because its fun
for me. Hacking BBS gateway stuff into the code is "fun" for me any
longer. Who's going to (IMHO) waste their time to develop an IP based
implementation for a VIC-20? If you want something, go ahead and do
it. But don't demand that someone else provide this extra function
FOR you. It is a hobby, and each of us has our own goals an
interests. The problem is, my goals and interests don't match your
expectations. Sorry about that.

What's in it for me? We don't get paid to write this software, we do
it 'cause it fun? It's only a hobby, right?

A version of the KA9Q NOS code for the Amiga can be had via anonymous FTP
from Sayshell.UMD.EDU in the /pub directory. I haven't had time to do a
port of the latest NOS code, but hope to get around to it some time.

The DataEngine ad also mentioned the 85C30. Is this also fully accessable
by developer code?

I want to make full duplex point-to-point links on 430/439 MHz. I also
want to avoid using a duplexer. Here is an idea I had:

Feed TX to a horizontally-polarized yagi and use a vertically-polarized
yagi mounted on the other end of a boom. How much isolation do I buy?
I probably need a balanced matching system for this work at all well so
let's assume that I use a toroidal transformer for the balun and a
T-match or something like that. Furthermore, I also agree to mount the
thing symmetrically on the tower.

PreS: Numerous replies in answer to my post "Commercial Data Radios"
and I will repost soon. Hint: the news is not very good.

Until NOS 900418, the transmit routine "kick started" the interrupt handler
whenever a frame is sent. One of my contributors suggested removing it,
claiming it may have been causing corruption of transmitted data. In any
event, it did seem unnecessary, at least with the NS16550A chips I use on my
system, so I took it out.

Apparently this breaks some systems with standard 8250 serial port chips. I
have since found that the corrupted transmit data problem was caused by
another bug that has also been fixed, so I'll reinstall the "kick start"
routine in my next update of NOS.

If you are managing a net/rom node or nodes, and have set any of the
parameters to non-default values, I'd like to know what values you chose
and why (except, of course, the rather obvious point of setting
maxframes to 1 on the access channel).

I manage a number of nodes here in town and have been tuning them the way
I think it ought to be done, but I'd like to compare notes on what other
people do.

No global hosts.net file exists, and if one did, it would be of very
little value, since the AMPRNet is not a connected network anyway.

To obtain the latest list for your area, contact the address coordinator
who assigns IP addresses in that area. Here is a complete list of those
people.

Doug,
   I suspect that spacial separation between antennas will be the best investment towards isolation. Avoiding feedline radiation through good balance and chokes is probably pretty important too since the two feedlines no doubt get pretty close together at some point. Using different polarizations may be helpful but probably not as big a help particularly if there are scattering and reflecting sources (ground clutter) fairly nearby. If you were to use opposite sensed circular antennas remember that reflection from a nearby specular reflector (as opposed to a scatterer) will reverse the sense and can actually make matters worse than if you were using two linearly polarized antennas. Similarly, a linearly polarized wavefront hitting a local scatterer will generate any variety of polarizations.

   Summary is: put the antennas as far apart as possible and the main beams as far away (in both ax and el) from anything close that can intercept RF. Do a good job of feedint the antennas. Use different polarizations too but don't count on that as buying as much as the other remedies.

The latest (and last) Macintosh version of the KA9Q Internet Protocols Package is now available for anonymous FTP from apple.com (/pub/ham-radio directory). Both NET and BM are there, executables as well as source code.

If you don't have FTP capability, you can send a formatted 800K disk with a stamped return disk mailer to Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129. Or send $5.00 in lieu of disk and mailer.

As previously announced, this will be the last Macintosh version released unless someone else takes over development. Our thanks are due to Doug and to Dewayne Hendricks, WA8DZP, for all their work on the Mac version over the past few years.

About 2 years ago I got a pair of them going using the midland 13-509 radios. They work fairly well used as a pair (talking to like radios). The secret to the G3RUH is that the transmitter modulation waveform is pre-distorted to take into account the other receivers IF filter distortion. This means that the modem is designed for a homogenous network (one in which all the recievers are the same or have similar IF characteristics). Reality says that in 220mhz this is probably going to be the case as I have not heard of anyone using anything other than 13-309's for medium speed work (4800-9600 baud).

WB9MJN wrote a very good article in 220 NOTES a few months back on what mods need to be done to make the radios work very well. The only mods I did to the radios were making them true FM (adding a VARACTOR to the TX XTAL) and bringing out the discriminator, PTT, and modulator lines.

After many months of waiting to see what was going to happen to the lower 2megs of 220 a few brave souls are going to put them on the air for real :-). We are going to use them for a 60mile hop between Ventura CA and Santa Barbara CA. Both ends are G8BPQ switches using DRSI boards.

73's Tom

Is the newest version of PE1CHL NET Atari ST version available via FTP somewhere. I have found the MS-DOS version from numerous places, and even the revision history for ST(!) but not the ST executables...

Please...

Kaj,

    I am on the Kantronix Beta list... they sent me a "beta" copy of
the USERS manual for this beast.... It looks interesting, can can support
several types of external modems.   Kantronix even asks developers to let
them know if there is need for MORE support for other types of Modems.

    The ad (I just saw it too) actually explains Kantronix intentions
BETER than their user manual.... Keep in mind, that the manual was for the
AX.25 code (and KISS) that they ship standard with the TNC..... I have not
seen the developers manual.....

    I thought a couple of outstanding features (of their software) were:

    1) The ability (through a *random* password algorithm) to control
       the TNC remotely

    2) A "HOST" mode (finally :-))

    I don't remember the rest.... It seems that this unit should allow
    developers to "roll their own" without worying about the hardware
    design... I hope the cost is reasonable!!!!

                  Rich

I was specifically told by the person who was head of technical development
at Kantronics a couple years ago that there was no such program for people
to do reviews or development. I assumed that people who were developing
other ROM code for the TNC's were doing so after doing their own reverse
engineering.

Has there in fact been an effort to allow certain people to develop code
for these machines that they could have been lying to me about?

I remember when the Macintosh computer from Apple first came out and Apple
was instituting a "developers program". Since NeXT did this as well, I

assume it was a Steve Jobs idea. However, when I pursued finding out about the program, I was told that the only people who were qualified were those who had already done development. I had not done development before because I didn't anything worth doing the development on. This started a bad view I had of Apple which has only gotten worse with other matters.

Now the question is, has Kantronics in the past acted this way? Is the future going to consist of them not holding back any technical information? One of the experiments I have in mind for a TNC involves doing some work on an arriving packet in real time during packet assembly making KISS mode not usable.

>   The ad (I just saw it too) actually explains Kantronix intentions

I was told today my Matt Foster at Kantronics that the Technical Developer's Manual for teh DataEngine will be available "sometime this summer".

>   I thought a couple of outstanding features (of their software) were:
>

What is "HOST" mode? The term is sufficiently vague for me to be able to come up with lots of grandiose things that could be called by this.

>   I don't remember the rest.... It seems that this unit should allow
>   developers to "roll their own" without worying about the hardware
>   design... I hope the cost is reasonable!!!!

Sorry, but I cannot imaging doing software development without worrying, or at least knowing, the hardware design. This is probably because I do work with software at the very lowest level and perhaps most programmers never do. If Kantronics has the perception of this, and supplies "technical" data on how to make use of their low level code without giving me a chance to write better low level code, then this machine is not the developer's machine I need. Running a PC and a TNC in KISS mode would serve this need well if I were restricted this way.

So far, all the information I have about the DataEngine cannot rule out that Kantronics is not making this machine 100% open. However, I have also not been able, yet, to exhaust all sources, so significant hope still exists.

Does anyone have any information on a "PC-100" from PacComm?
I understand that this is a 2-port (8530) board that plugs in
to an XT, and is supported (to some extent) by the KA9Q NOS
software.

I have read here that you can get these "bare boards" from
PacComm for around $30 or so. What I'm wondering is, are there
any EPROMS or PALS on the board? Also, I understand there are
modems on board, are there also some sort of disconnect headers
to allow plugging in to 9600 bps modems (like the K9NG from TAPR)?

I'm really just looking for the simplest & cheapest way to add an
8530 to my XT, so that I can run higher-speed TCP/IP with NOS. (I
do have a couple of 8530's and AMD7910's in the junk drawer)

Any information on either PC-100, or alternative ways to add an
8530 & necessary support to an XT would be greatly appreciated.

Hello
My father 4X1GP is giving a series of lectures to a ham club members on
the subject of packet and digital communications.
I'd like to ask if anyone has any materrial he can contribute to this
effort to give a better covrage and depth to the subjects he is about to
cover (from RS-232 to TCP/IP and Satelites).

Please mail me direct at: <ofer@genius.tau.ac.il> or <ofer@taurus.bitnet>
Many thanks and 73
Ofer Lapid 4X6OJ
4XNET TCP/IP Subnet coordinator.

>X-Mailer: Mush 6.5.6 (PC R6.3 22-Sep-89)

Here is the updated results of my research into data radio possibilities.
The information is now suffixed with a date.

PacComm: no longer in the picture. They have withdrawn their earlier
NB9600 series and its successor is nowhere near production. "Six months,
maybe?" was the answer. That probably means never. Their G3RUH modem
is still available, however, and plugs right into their own TNCs and
TNC2 clones. I got several reports saying the the G3RUH works well with
several different kinds of modified radios, and it works with no mods
with the Kantronics DVR2-2. (1990-05-15)

Kantronics: paydirt! The DVR2-2 (144MHz, 2W) works with the G3RUH modem
at 9600 baud. Lists for $239US. Compatible with a 30W power amp from
RF Concepts, list $129US. The whole thing is tested and works with a
TXD of 4 (40 ms). All shipping now. The 440MHz version of the
Kantronics DVR2-2 is not yet available. They expect to ship in
mid-July. I don't have any idea how reliable this estimate might be.
The Data Engine is shipping now, so there's something. (1990-05-15) I
got a note saying that an engineer at Kanx reported that the DVR4-2
(440MHz) will likely be frequency synthesized. I don't see how they

can have it in production and shipping by "mid-July" if they haven't even finalized the design - but then, what do I know? The price of the DVR2-2 has been reduced to $219US. (1990-05-20)

TAPR: the PacketRadio is still in neverland. Betatest has not started. Someone has the flu or maybe something more awful. They plan to offer it as a kit and also license it to commercial outfits. They figure the kit will be out in September but I really doubt that - their estimates have been very optimistic on this project so far. But I don't think it is fair to call it the "VapourRadio" (as funny as it is) considering that they showed the boards at Dayton. (1990-05-14) Since then I read in QEX that they haven't even designed the whole thing yet but I don't know when that article went to press. TAPR also sells the K9NG 9600 baud modem, which is what the G3RUH is supposed to be compatible with. The K9NG is half-duplex; the G3RUH is full duplex and has a digital TX filter that can compensate somewhat for poor receiver response. This is good if you are using a repeater or if everyone has the same type of RX. (1990-05-18)

Hamtronics: They have a modem, RX, and TX that are supposed to do 9600 baud. Their catalog hasn't arrived so I can't give more details. Does anyone have first-hand experience with this stuff? Second-hand? But I really don't think publishing rumours is worth anything. (1990-05-24)

AEA: nothing. The only data RF product they had has been cancelled and there is nothing up their sleeve. The PS186 data switch platform is in neverland. "You mean it's waiting for someone to make up his mind?" "Something like that." You know what they say: "Confused minds say No." (1990-05-15)

DRSI: The guy at DRSI told me that they are thinking about making a 4W data radio for the Amateur market which would be similar to the commercial ones they have made. Committed to the idea but no particular date in mind right now. A high-speed modem is currently a higher priority for some reason. (1990-05-15)

GLB: I called up GLB and they have an integrated data radio called the "Netlink 450" available now for $1495US. It is a half-duplex unit with 9600 baud stock, higher data rates on special order. The controller is built-in, data appears on an RS232 port. All details of transmission are handled inside the box - I don't know how it is done or what is done about callsigns, if anything. It sounds like a good thing for trunking. The price sounds high but you have to consider that it includes just about everything needed to make it work, even in high RF environments: TNC, fast switching RX/TX (1 ms), TX 2W (12W available), 5 helical RF filter. The specs sound very good, too: ovens on the crystals, digital AFC, sensitivity .6uV for 10E-3 BER, -60dB RX bandwidth is 30kHz, TX bandwidth 15kHz for 9600 baud. (1990-05-20) They also sold a 19.2kbaud unit a while back but this has apparently been discontinued since they certainly didn't mention it to me and did not include it in their literature. (1990-05-24)

GRAPES: The Heatherington (,WA7DSY,DSY) 56kbaud modem is available

from GRAPES and works. It is an RF modem operating in the 30MHz
range and therefore needs a transverter for VHF or UHF operation.
Phil tells me that the modem+xverter can be assembled for $500US;
however, he didn't tell me where to buy the transverter. A 432/28
transverter I located was priced at $599US. You still need a controller
of some sort, of course, and I read that a street-legal TNC can't
cope with 56k on its radio port. GRAPES uses a bored and supercharged
TNC2 - I don't know exactly what they do to it - and then there is
the new Kanx Data Engine, which has two 56k ports on it. Seems very
odd that they didn't put a 56k host port on as well - why not? (With
any luck it just needs a bitrate clock generated somewhere and the
mod will be easy)

======================

I still welcome comments and more information - post a note.

73 doug.

Interesting - I just tried an nslookup of an ampr.org site and my
machine found a couple of nameservers - thumper.bellcore.com and ucsd.edu!

Yes, of course they did, since you asked on the internet. Now turn on
your radio and switch over the the tcp/ip channel in your area, and
ask your nameserver about some host you know to be in, say, New Mexico.

Oh, no nameserver responded?

As I said, it's not a connected network.

Any questions?

I did the same and found both servers mentioned above plus 2 more I think and about 2500 or so hosts. I doubt if many are reachable. The only question I have though is just how did all those hosts get caught up in ucsd's domain tables? Did someone temporarily hook up a gateway which had accumulated a lot of hostnames to the Internet?

On another topic, does anyone have a list of HF TCP/IP hosts that serve as bridges to more local/regional TCP/IP networks? Or to put it another way, if I wanted to link a Hawaii AMPRnet to the mainland who should I be talking to? And an even more fundamental question, just how well connected are the regional AMPRnets across the mainland (and beyond)?

Ok, here's our KISS racing secret. We use a nitro-injected jumper to
set the clock to a high illegal 8 mhz and then we install Dale's
ported and polished KISS-56 rom. A few RAD cuts and solders later,
and shazam - a street-legal 56kb driver. :-)

Note that the link to the PC is still 19.2 kb so the thruput is limited
to this. We recommend going with one of the aforementioned driver
boards but a souped up TNC-2 will work in a pinch. We supply modifications

and the ROM with the kit.

There are messages currently circulating on packet BBSs out here on the
left coast that would seem to indicate that the firmware wars are
heating up again.

Unfortunately, I can't seem to pin down anyone who knows first-hand
what's going on. Story, as I heard it from several sources, seems to
be that supporters of one particular type of networking software have
been urging the government agencies and managers of sites containing
nodes running the probably-less-legitimate other version of that
software to do something about it.

Since most radio site owners barely tolerate hams in their mountaintops
anyway, all it seems to take is a little concerted harrassment by one
faction or the other, and the edict comes down "ok, that's enough, all
the ham stuff goes". And it would seem that's what's happening.

So out here in beautiful LA LA Land, it would seem that it's not just
packet radio that's become a political football, but the private remote
bases and open voice repeaters are getting tossed over the goalposts too.

At the swapmeet the other day, people were wondering how long it would
be before someone did something irrational. After all, this is the
land of freeway shootings, and the hot weather is just getting started.

See, and all along you thought networking was just a matter of solving

some technical problems. Hah.

Seems a Pyrrhic victory to me. And nobody is the winner.

Last I was down there GLB still had some on the shelves. They run in the 220 band and I think they stopped pushing them when we lost a major chunk of that. I'm pretty sure you can still get them, though. If anyone is interested, I'll see them Wednesday nights and can get more info.

I am reluctant to post until I have everything working-working but I have designed an 8530 card which can be built and populated for about $50. It uses a JDR prototyping card, the kind with the decoding pals and buffers already etched on the board. I came up with replacement pals and a schematic to make it emulate the Eagle board, at least as far as the driver in NET (and NOS?) works. There is no DMA (the NET driver doesn't use it, I am not sure if the Eagle originally had it) but the same interrupt masking and addressing is supported. I have built a board and tested it from debug but have not run it with the driver yet. This proved the design of the PALS and such could talk to the chip as I expected to. I don't know yet if this is what the driver really expects. I was waiting to get the right oscillators and haven't gotten back to it yet.

I can email schematics (Postscript and Orcad) and PAL files (PALASM and JEDEC). I can be reached below. The files are also available for FTPing from n1dxg.ampr.org in the New England Area. For $12 I can send a set of PALs, a disk and the crystal oscillator needed.

When this is playing with NOS I will more formally announce it and distribute it better.

"They, that can give up essential liberty, to obtain a little temporary
 safety, deserve neither liberty nor safety." -- Benjamin Franklin 1759

There have been several postings requesting information on
how the "BBS net" forwards messages. There are a number of
different things to consider: SID (System ID), BID (Bulletin
ID), use of "OK/NO", the connect exchanges, and command
syntax. These are all spelled out in my documentation, which
you can get from your local 'rli bbs sysop - via packet.

My name is Jose ZAPICO, working in the research center of oil industries
in the automation area. I'm a ham , and more specific a 'paketeer'.
My callsign is YV5FSF . You can contact me via AX.25 with the following
path YV5FSF@YV5HXF.CCS.VEN.SA.

I would like to know how can i do, to contact KA9Q by this way. I need to
know if there is a new revision of the 890421.1 (the revision that I have)
in the KA9Q Internet Software Package. I want to connect to a ethernet 802.3
encapsulation via a 3com503 to one side, and to a KISS modem to the other
side.

Please respond by E-mail. Can I have your path via some BBS in AX.25.

Thank you.
Jose Zapico.

I've got to be missing something. I've set up two stations 30 miles apart and both ends are running TCP/IP. I can successfully run telnet and ftp although it seems to lock up when the link (2m) gets marginal. When I try to telnet, ftp, ping or otherwise access another TCP/IP station I don't get past the outgoing ARP. I never get a reply. I have a valid route (just default to ax0) and I'm transmitting, but although the station may peg my S-meter it never answers. I suppose the stations I've tried could have all their servers turned off, but that's pretty unlikely. I've also tried an arp entry pointed to a local Ax25 node and I've tried netrom routing although I admit I don't fully understand if I can do that station to station without knowing if a real (IP) gateway exists.

Would someone explain the basics. I know I should be able to get my packets a little further than I'm able to now. I can hear three or four stations transmitting TCP/IP and my netrom routing table has lots of stations listed as IPXXX.

A few years back it seems that one of the "game" computers, atari, commodore, or something had an attatchment, two electrodes to the head and some software by which the user could control movement on the screen. You might check with some atari, etc. gurus on this. Just make the check out to ;-)

My first guess would be that the other station's TXDELAY is a bit too short. Try the following, open your squelch control and try pinging the other stations. If your station picks up the echo, then they either need to increase their txdelay slightly or you need to leave your squelch open. This cure will work only if your receiver has a slow acting squelch gate which can be overcome by just opening it up. And it also applies to non-TCP/IP stations as well.

In the case you make here which reciever are you "pre-compensating" for?
The repeater Receiver? or the "random station"? Either way the G3RUH modem
needs to know the IF characteristics of the receiver to which it is transmitting.
Otherwise just set the modem for "analog loopback" and forget "pre-compensation".
Does your repeater have DC continuity between the Discriminator and the
Modulator? How are you planning to do your regeneration? The K9NG does not do
full duplex and as far as I can tell the G3RUH has problems with doing full
duplex because of clocks. What I have put together is a G3RUH as a demod. and
a K9NG as a modulator. I still think that there are problems even with this
setup. The best thing I have seen is a IF translator. There is no distortion
introduced (if the passband of the translator is wider than the signal) but,
you still have the problem of having to know the "random station's" IF
characteristics to use the "pre-compensation" feature.

Why is it that when I run NOS that I cannot connect to my local NET/ROM
node, then connect back to myself to get a "mailer"? I just get a Busy.
In addition, when one of my buddies (who is not running TCP/IP) tries to
connect to me, he also gets a Busy?

I used to use NET and this worked OK. What is the major difference between
NET and NOS?

Here is more information from the terrific Gera Ivanov regarding packet radio in the USSR. My crusade for information continues - anyone with further leads, PLEASE let me know!

----------Original message----------

Of course, packet radio don't widely spread in USSR.

Soviet radio amateurs have got official permission from USSR ministry of communications for packet radio operation since March, 1990. After official permission increase quantity of packet radio amateurs. Now, I think, it is about 30-40 active soviet callsignes in packet mode. I know personally sufficient part of them. Well known (and active now) - UB5UN (Sergei Bunin, Kiev), RW3AH (Andrei Fedorov, Moscow), RA3AT (Leonid Maksakow, Moscow).

Of course, main problem is lack of contemporary amateur radio equipment in USSR. Till this time main part of soviet ham's use homemade equipment. Not because of enjoyable soldering work, but because of lack of commercial equipment.

Formerly home made equipment satisfactorily used for CW telegraph operations or SSB telephone operations. Now packet radio requires in high quality equipment based on frequency synthesizers and microprocessor control. Of course, such type equipment impossible to assemble at the kitchen!

Despite of mentioned serious difficulties, there are some active packet radio callsignes and rudimentary network.

In Moscow works now two active radio BBS's - RS3A and RK3KP.

RS3A is callsigne of Satellite Communications Laboratory. Formerly, before official permission issue, laboratory used special licence and callsigne EK3AZO. System operator - RA3AT. BBS based on PC compatible computer and WA7MBL v.5.12 mailbox software. Mailbox uses two ports - HF port, and VHF port. HF frequency is 21.117 MHz. Main forwarding correspondent - 4X1RU (they often received AMSAT bulletins).

RK3KP is callsigne of Komsomolskaya Pravda Expedition Club station. System operator - RA3APR (Evgeni Labutin). BBS based on PC compatible and TheBOX v.1.6 mailbox software. This BBS also uses two ports - HF and VHF. HF frequency is 14.095 MHz. Main forwarding correspondent - DK0MWX.

In Moscow now works small VHF network. Active callsignes - UZ3AZO (club, VHF PBBS), RW3DR, RA3APR, UK3F, RW3AH.

Among other locations it is active UB5UN, RA9YD.

After armenian earthquake there were delivered (and, I suppose,

installed) some packet radio terminals, based on Tandy 102
portable computer, PK88 TNC and Yaesu FT23R VHF transceiver.

FT736 & 9600 Baud Operation

by James Miller G3RUH

These notes tell you where to get FM RX audio direct from the
discriminator, and where to modulate the FM TX varactor directly. These
mods are non-destructive and take no more than a few minutes. The signals
bypass the "DATA SOCKET" for high grade FM operations.

The RX mod is suitable for:

 * UOSAT-D 9600 baud downlink and terrestrial links
 * 1200 baud AFSK/FM Standard Packet - BUT IT'S UNSQUELCHED.

The TX mod is suitable for:

 * FO-20/PACSAT uplink (1200 bps Manchester FM)
 * UOSAT-D 9600 baud uplink direct FSK and terrestrial links
 * 1200 baud AFSK/FM Standard Packet.

---******---

FT736 - FM Direct from Discriminator

Detected FM direct from the receiver discriminator is available from the
RX UNIT at the junction of R91 and C83. These components are shown in the

top right-hand corner of the schematic.

Proceed thus:
 1. Disconnect FT736 from the mains electricity. (Safety).
 2. Remove top cover only.
 3. RX Unit is the vertical module on the left.
 4. Locate R91 which is about 25mm from the top, 50mm from the radio rear.
    the resistor is "on-end", and near a couple of glass diodes.
 5. Scrape any paint off R91's free end and wet with solder.
 6. Your RXaudio lead should be a fine screened cable; connect the inner
    to R91, and the outer braid to a ground point (e.g. can of TO09)
 7. Route the cable out though any convenient aperture in the case.
 8. The discriminator sensitivity (FM Normal) as about 6 kHz/volt.

Important note on 9600 Baud Use

Most FT736 receivers are fitted with an LFH12-S IF filter for FM. (CF01 at the top front of the RX Unit). This is a 12 kHz bandwidth filter which is a little narrow for 9600 bps FSK operation. It is recommended you change this to 15 kHz or better still for UOSAT-D use, 20 kHz bandwidth which will allow more tolerance for doppler shift, and give a far better "eye". Suitable filters are: LFH-15S or CFW455E, and LFH-20S or CFW455D. The first of these is a Yaesu spare part, and is often already fitted. Try the standard first and see what happens; these filters have moderate part to part variations.

---******---

FT736 DIRECT VARACTOR FM MODULATION

Refer to the circuit diagram; inject your TXaudio at the junction of R32/C29 on the TX Unit. The signal level at this point should be 800 mV peak-peak, and will give +/- 3 kHz deviation. DO NOT EXCEED THIS LEVEL. Set Mic Gain to min.
